INTRODUCTION:

The purpose of this thesis is to submit a design of a Trickling Filter which can be used as a Secondary Treatment of Sewage for East Lansing and Michigan State College.

ACKNOWLEDGMENT:

The author wishes to thank Professor
Frank H. Theroux for his advice and
help in preparing this thesis.

General Information and Present Conditions

Sewer System: East Lansing is served with a combined sewer system which delivers the sewage to an interceptor adjacent to the Red Cedar River. The sewage from Michigan State College is added to the East Lansing flow in the interceptor. The interceptor is provided with overflow chambers so that in time of excessive storm water run-off, part of the flow is diverted directly into the river.

Sewage Treatment Plant: The interceptor sewer terminates at the sewage treatment plant located near the west city limits of East Lansing, about one-quarter mile below Harrison Street Bridge, on the south bank of the Red Cedar River. The plant consists of a pumping station, a bar-rack screen, an Imhoff tank, and a sludge bed. The effluent from the Imhoff tank discharges into the Red Cedar River at the plant site.

The present plant was placed in operation in 1923. It secures the removal and treatment of only a portion of the suspended solids. The balance of the suspended solids and all those in solution discharge to the river in the plant effluent. A plant of this kind effects only about one-third of the organic solids in the sewage. Thus two-thirds of the organic solids pass to the river unchanged. It is the organic solids in sewage which are the causes of offensive conditions from the sewage. The principle objective of sewage treatment plants is to change the organic matter, both suspended and dissolved, into sufficiently innocuous, more stable compounds so that the plant effluent may be discharged into a diluting body of water without causing objectional conditions. The degree to which these changes need be

carried out depends on the diluting body of water, its volume of flow, the uses to which it may be placed, and its location. This plant does not appreciably effect the bacterial content of the sewage, and thus the river is grossly contaminated by the present plant discharge.

River Conditions: The flow in the Red Cedar River is generally very low during several months of the year and entirely inadequate to avoid offensive conditions and gross contamination of its waters, due to the sewage load it now receives from the East Lansing Sewage Treatment Plant. (Table I) The result is that the river is in a very objectionable condition from the point at which it receives the plant effluent, down to its entry into the City of Lansing.

The location of this stretch of river, through a residential and recreational area, makes it desirable to maintain it in its natural condition. The river just passes adjacent to the Lansing Red Cedar Municipal Golf Course, then adjacent to or near a residential development contiguous to Lansing, thence through Potter Park, a municipal park of the City of Lansing, and thence through a portion of the City of Lansing to its junction with the Grand River.

Detailed Information

It is recognized that a river has a certain digestive capacity to take care of sewage without offense. In order to determine the conditions which may result from the variable river flow, the flow records have been tabulated below on a basis of time.

Surface Elev. G gage = 821.76'

Max. high flood = 833.00'

Ord. " " = 829.00'

Low water = 821.00'

Table No. I

Average monthly Red Cedar River flows, according to occurrence

Design Basis

Population:

Pop. of E. Lansing

1910 - 802

1920 - 1339

1930 - 4380

Enrollment of M. S. C.

1910 - 1503

1920 - 2036

1930 - 4423

Total E. Lansing and M. S. C.

1910 - 2470

1920 - 3325

1930 - 8717

From Graph I, the estimated population of East Lansing and Michigan State College is 15,000 in 1960. My Design Basis is 15,000 population.

Flow: Assume sewage flow of 125 g. c. d. which will be excessive and on safe side. Also it will allow for any extra flow that comes during freezing weather with taps running.

Design basis = $125 \times 15,000 = 1,875,000$ gallons per day.

In writing this thesis I wish to contribute a design of a Trickling Filter which operates from the Imhoff Tank effluent. It is a Secondary System of treatment which will remove enough of the organic solids left in the Imhoff Tank effluent to make its own effluent unobjectionable.

The Trickling Filter will consist of a dosing tank, and a circular stone bed which is fed by four revolving arms, that move by the force of water coming out of the orifices. The sewage trickles through the stone bed and the effluent passes to the river by gravity flow.

For a detention of two hours in the Imhoff Tank sedimentation

East Lansing, Mich.
Population Estimate
May 1937 M. Lehnhardt

GRAPH I

channels, the capacity is as follows:

$$\text{Volume of channels} = 3(6.5 \times 7.33 + \frac{7.5 \times 6.75}{2}) 30 = 16230 \text{ cu. ft.}$$

$$\text{Flow for 24 hours} = \frac{24}{24} \times 16230 \times 7.5 = 1,460,000 \text{ gallons}$$

In 1930 a daily flow curve was plotted (Chart I) and the flow was 1,000,000 gallons average for 24 hours. Since the flow was measured in April, this can be expected to be high due to infiltration. At the present time, due to increased enrollment at M. S. C. and population of E. Lansing, the flow is probably above 1,000,000 g. d.

11

Dosing Tank

Design basis of 1,875,000 g. d. = 2.9 c. f. s. average

Use one dosing tank with 3 - 14" siphons to dose the filters in succession for 8 minute periods each.

Design for a draw-down of 24" for best operation of filters.

At 2.9 c. f. s. for 8 minutes = $8 \times 60 \times 2.9 = 1392$ cu. ft.

Size of tank = $\frac{1392}{2} = 696$ cu. ft. - use 20' x 35' tank = 700 cu. ft.

The present flow is now around 1,000,000 g. d. = 1.54 c. f. s.

Using this same dosing tank the dosing periods would be

$$\frac{1392}{60 \times 1.54} = 15 \text{ minutes}$$

Design of Filter Tank

Design basis = 1,875,000 g. d.

At 400,000 g. A. d./foot depth and 6' depth, the capacity of the filters will be 6 x 400,000 g. A. d.

$$\text{Area required for 1,875,000 g. d.} = \frac{1,875,000}{2,400,000} = 0.78125 \text{ A} = 34145.44 \text{ ft}^2$$

$$\text{Use 3 filters, each} = \frac{34145.44}{3} = 11381.81 \text{ ft}^2$$

$$\text{Dia. of each} = \sqrt{\frac{11381.81}{.7854}} = 118' \text{ say } 120'$$

$$\begin{aligned} \text{Area of each} &= .7854 \times 120^2 = .7854 \times 10^4 \text{ (area of well)} \\ &= 1131.22 \text{ ft}^2 \end{aligned}$$

$$\begin{aligned} \text{Volume of ballast} &= 3 \times 1131.22 \times 6 \times \frac{1}{27} = 12,462.44 \\ &\text{yds. for 3 filters} \end{aligned}$$

$$\text{Area 3 filters floor drainage system} = 33693.66 \text{ ft}^2$$

B. O. D. load:

For 5 day B. O. D. per cap. of 1.167# per day per person

$$\text{Design pop.} = 15,000$$

$$\text{Storage 5 day B. O. D.} = 15,000 \times 1.167 = 2505 \text{ ft}^3/\text{day}$$

$$\text{Ca. ft. of ballast per lb. 5 day B. O. D.} = \frac{6 \times 33693.66}{2505} =$$

$$80.70 \text{ Ca}$$

Design of Filter Tank (Cont'd.)

Design of Footing:

$$\text{Wt. of stem} = 150 \times 1 \times 1 \times 6.5 = 975\#$$

$$\text{Estimated footing wt.} = 300$$

$$\text{total} = 1275\#$$

$$\text{Soil pressure} = 2000\#/\text{ft}^2$$

$$\text{Area of footing} = \frac{1275}{2000} = .6375\text{ ft}^2/\text{ft. length}$$

This will give a footing smaller than the wall it supports, therefore increase the footing to 12" x 24".

The bond between the footing and the stem will be taken by the 4" key as shown in sketch. Also the vertical stem from the stem will give extra bond.

Reinforcement for side walls of tank

Hoop tension

1. Foot

$$5.5 \times 62.5 \times 60 = 20,000\# \text{ tension}$$

$$A_s = \frac{20,000}{16,000} = 1.25\text{ in}^2$$

$$\text{use } 3\frac{1}{4}" \text{ round Bars} = 1.32\text{ in}^2$$

2. Foot

$$4.5 \times 62.5 \times 60 = 16,900\# \text{ tension}$$

$$A_s = \frac{16,900}{16,000} = 1.05\text{ in}^2$$

$$\text{use } 1\frac{3}{4}" \text{ round bars} = 0.44\text{ in}^2$$

$$\text{" } 2-5/8" \text{ " " } = \frac{0.62\text{ in}^2}{1.05\text{ in}^2}$$

3. Foot

$$3.5 \times 60 \times 62.5 = 13,100\# \text{ tension}$$

Design of Filter Tank (Cont'd.)

Design of Footings:

$$\text{Wt. of stem} = 150 \times 1 \times 1 \times 6.5 = 975\#$$

$$\text{Estimated footing wt.} = \underline{300}$$

$$\text{total} = 1275\#$$

$$\text{Soil pressure} = 2000\#/\text{ft}^2$$

$$\text{Area of footing} = \frac{1275}{2000} = .6375\text{ ft}^2/\text{ft. length}$$

This will give a footing smaller than the wall it supports, therefore increase the footing to 12" x 24".

The bond between the footing and the stem will be taken by the 4" key as shown in sketch. Also the vertical stem from the stem will give extra bond.

Reinforcement for side walls of tank

Hoop tension

1. Foot

$$5.5 \times 62.5 \times 60 = 20,625 \# \text{ tension}$$

$$A_s = \frac{20,625}{16,000} = 1.29\text{ ft}^2$$

$$\text{use } 3\frac{1}{2}" \text{ round bars} = 1.32\text{ ft}^2$$

2. Foot

$$4.5 \times 62.5 \times 60 = 16,875 \# \text{ tension}$$

$$A_s = \frac{16,875}{16,000} = 1.05\text{ ft}^2$$

$$\text{use } 1\frac{1}{4}" \text{ round bars} = 0.94\text{ ft}^2$$

$$\text{" } 2-5/8" \text{ " " } = \frac{0.62\text{ ft}^2}{1.05\text{ ft}^2}$$

3. Foot

$$3.5 \times 60 \times 62.5 = 13,125 \# \text{ tension}$$

Design of Filter Tank (Cont'd.)

Reinforcement for side walls of tank (Cont'd.)

3. Foot (Cont'd.)

$$A_s = \frac{13,180}{15,000} = 0.879 "$$

use 3-5/8" round bars = 0.89 "

4. Foot

$$0.5 \times 60 \times 62.5 = 1,875 \# \text{ tension}$$

$$A_s = \frac{1,875}{15,000} = 0.125 "$$

use 3/4" round bars = 0.125 "

5. Foot

$$1.5 \times 60 \times 62.5 = 5,625 \# \text{ tension}$$

$$A_s = \frac{5,625}{15,000} = 0.375 "$$

use 2-3/4" round bars = 0.375 "

6. Foot

$$0.5 \times 60 \times 62.5 = 1,875 \# \text{ tension}$$

$$A_s = \frac{1,875}{15,000} = 0.125 "$$

use 1-1/2" round bar = 0.125 "

Amount of steel for side walls of tank

$$C = \pi D = 120\pi = 377'$$

steel coming in 20 foot lengths

$$\frac{377}{20} = 19 \text{ lengths}$$

at 40 dia. per length for bond - 7/8" round = 30"

$$\text{length of steel} = 377 + 19 \times 30 = 955'$$

3/4"	round steel	=	955	x	4	=	3820'	
5/8"	"	"	=	955	x	5	=	4775'
1/2"	"	"	=	955	x	3	=	2865'
							<u>7860'</u>	

Vertical steel - $\frac{1}{2}$ " round and 7' length @ 20'

$$\frac{377}{20} = 19 \text{ lengths}$$

$$19 \times 3 = 57' \text{ of } \frac{1}{2}" \text{ round}$$

Wt. of steel - one tank

$$\frac{1}{2}" \text{ rd.} = 3552 \times 0.668 = 2373 \#$$

$$5/8" \text{ rd.} = 2125 \times 1.043 = 2216 \#$$

$$\frac{3}{4}" \text{ rd.} = 1700 \times 1.502 = \frac{2553}{7140} \#$$

$$7140 \times 3 = 21,420 \# \text{ for 3 tanks}$$

$$\frac{21,420}{2000} = 10,710 \text{ tons}$$

No. of blocks for bottom of filter (one tank)

$$\text{each block} - 5" \times 10" \times 12" \text{ with } \frac{1}{2}" \text{ mortar on sides} = 10\frac{1}{2}" \times 12\frac{1}{2}"$$

$$10 \text{ blocks } 1 \text{ sq. yd.}$$

$$\text{no. of blocks required} = \frac{A \times 10}{9}$$

$$= \left(\frac{20^2}{9} - \frac{10^2}{9} \right) \times 10 = \frac{11231.02 \times 10}{9} = 12479 \text{ blocks}$$

$$\text{for 3 filters} = 3 \times 12479 = 37437 \text{ blocks}$$

Design of Trickling Filter Arm

Design flow = 1,875,000 g. d. = 2.9 c. f. s.

$$V_{14} = 2.71 \text{ ft/sec.} \quad \frac{2.9}{A} = 0.725$$

try 4" arm

$$\text{entrance loss out of dosing tank} = \frac{v^2}{2g} = 0.114'$$

$$\text{friction loss } 100' - 14" = 0.300'$$

$$\text{two elbows } \frac{1}{2} \text{ vel. hd. each} = 0.057'$$

$$\text{frict. loss } 38' - 4" \text{ arms } (175 \times \frac{1}{4} \times 2.9) = 0.020'$$

$$\text{entrance loss to arm} = 1\frac{1}{2} \text{ vel. hd.} = \underline{0.171'}$$

$$\text{total loss of head} = 0.662'$$

$$\text{Average head at orifice} = 4.0 - 0.662 = 3.338'$$

$$\text{try } \frac{1}{2}" \text{ orifice with } 3.338' \text{ head } C = 0.6, \frac{1}{2}" = 0.00137"$$

$$Q = 0.6 \times 0.00137 \times 8.02 \times 3.338 = 0.00123 \text{ c. f. s.}$$

$$\text{no. of orifices needed} = \frac{2.9}{0.00123} = 240 \text{ orifices}$$

Therefore: use 4-4" distributing arms with 60 $\frac{1}{2}"$ orifices each
