PURPOSE

Conscious home management and its effect on the family has long been a topic of discussion. Home management, Family life, and Child Development educators have often concerned themselves with the factors of family size and the age of the children in their relation to the actual management practices of the homemaker.

The purpose of this study is to determine the relationship of economic level, residence, parental education (including the Home Economics training of the Mother), and family size to five specific items relating to Child Development: (1) toy purchases, (2) purchasing of household furnishings, (3) reading material bought for children, (4) the method used to prevent the misuse of toys and furnishings, and (5) the amount of time spent on child care and training by the family members.

The statistics analysed in this study are a part of the material collected by Evelyn Zwener of Michigan State College under the direction of Br. Irma Gross, head of the department of Home Management and Child Development.

GENERAL INFORMATION CONCERNING THE CRIGINAL STUDY

The purpose of the study "Management in Michigan Homes" was to determine that factors in the home influenced the management practices of that home. It is generally written and accepted that family size and the age of the children have a definite effect on the practices of homemakers; but what other factors play a part in the management of the household had yet to be determined. Consideration and investigation were to be given the factors of economic level, place of residence, parental education, Home Economics training of the Mother, the husband's occupation, the homemaker's incentives for conscieus management, and the effect of labor saving devices. These and other similar topics were used as a basis for forming a schedule to be used in interviewing the homemakers.

After a preliminary survey of research methods, leading to the decision to use the schedule and interview method, a schedule was developed. One person did all the interviewing. The interviews were begun in the fall of 1939 and completed at the end of 1941.

The sampling for this management study was taken from seven Michigan counties, Menominee in the Upper Peninsula, Benzie, Charlevoix, Saginaw, Shiawassee, Kent, and Berrien in the Lower Peninsula,

Eight eligibility requirements and five basic controls were set up to establish the sampling. They were:

- 1. Only families of the white race.
- 2. Families who were independent financially.
- 3. No broken families.
- 4. Families established for at least one year.

- 5. Families whose members were living together as a group.
- 6. Households which included only one family.
- 7. Families in which the homemaker's chief occupation was homemaking.
- 8. Families keeping roomers and boarders providing the number was three or fewer.

Basic Controls:

- 1. Community. Fifty per cent farm families, villages under 1,000 population. (25 per cent), and villages with a population from 1,000 to 2,500 (25 per cent). When the data were analyzed, they were put into two groups only. Both sized villages were analyzed together.
- 2. Economic level. Three economic levels: comfort, medium, and low. They were set up as follows; farm families with annual money income \$750 or less in the low economic group, farm families \$750 to \$1,750 annually the medium economic level, and those exceeding \$1,750 comfort level. Village families with income to \$1,000 on low level, medium \$1,000 to \$2,500 a year, and comfort level above \$2,500 annually.
- 3. Family composition. Unbroken homes of three types: childless families, families with one or two children, and families with more than two children.
- 4. Age of children. Three groups of approximately even size: children under five years of age, children five to sixteen years of age, and children over sixteen.
- 5. Occupation of Head of Household. Farmers 50 per cent,

Intropreneurs 5 per cent, Salaried persons, 20 per cent, and Wage

Barners. 25 per cent.

A report of some of the findings from this study have been written in the Michigan State College Agricultural Experiment Station Technical Bulletin 196, "Management in Michigan Homes" by Dr. I. H. Gross and Miss L. A. Zwemer. In the area of accepted managerial practices there was noted a wide acceptance of the conservation of materials; the study showed a need for reaching the lewer economic group before any action could be established on recommended practices.

The family management pattern was largely democratic - usually the husband and wife participated. There was however a need for including children in decisions concerning family management. Rising economic level apparently did not insure a rise in democratic methods.

Michigan homemakers in this study were definitely aware of the many tangible and intengible aspects of management. Consciously and unconsciously they spent their family resources to increase spiritual, aesthetic, and community life.

SAMPLING AND QUESTIONS USED FOR THIS STUDY

Two hundred and twenty-tive cases from the original study of 382 homes were used for this thesis. Of these, 112 were families with children from birth to five years of age and 110 familes with children five to sixtemyears of age.

The	familiae	TATA	Advi And	 70110-0

The questions from the schedule which were used as a basis for this study are listed below with the page number following to indicate the location of the question in the mimeographed schedule.

- 1. Composition of family age and education (p.1).
- 2. The time spent on child care and training by the family members (p. 3).
- 3. Home Economics training of the mother (p. 3).
- 4. Economic level (p.4).
- 5. Residence (p. 4)
- 6. List of the last five toy purchases with an evaluation as to their durability by the homemakers (p.12).

- 7. Methods used to prevent the misuse of toys. (p. 12)
- 8. Farmishings bought with durability in mind if there are small children in the family. (p. 12)
- 9. Magazine purchases (Recorded on back page of schedule by interviewer.)

been made according to the age level of the majority of children in the family. These families in which the majority of the children were five years of age or younger are considered in the birth to five year group. Tamilies in which the majority of children were over five years of age were classed in the upper level group of five to sixteen years. A family might however have a child in the age group in which it was not classified. This fact accounts for what might otherwise be a questionable purchase, for example, a rattle by a family classified in the five to sixteen group.

In order to facilitate a greater use of the material in a more readable form many of the tables to follow are based on a frequency index. This index was determined by dividing the total number of purchases (whether it was toys, furnishings, or reading material) by the number of cases concerned with that particular problem. An index of 1.00 therefore would indicate one purchase per family. An index of less than 1.00 shows the purchase of fewer than one article per family while an index above 1.00 indicates the purchase of more than one article by the families interviewed.

The section on darability of the toys purchased needs explanation only on the point of the determination of durability. The homemakers when asked their last five toy purchases were also asked to evaluate the durability of each as to its being sturdy or fragile. There is therefore no assurance that toys rated sturdy by one homemaker would have been classified the same by another homemaker.

It will be well to bear in mind in using the tables on the time spent on child care that the number of hours was estimated by the home-maker. There is room for question as to the exactness of her judgment of the time consumed in child care, training, and guidance by other family members.

SURVEY OF THE LITERATURE

A general survey of the research and periodical literature available which would relate to the topics included in this study brings little of significant value to the front.

The Child Development Abstracts for the last five years present no research material applicable to the problem. The Readers Guide, Education Index, and the indexes of popular magazines show occasional literature of a popular nature but the articles seldom have any statistical evidence behind them. The subject of toy purchases has enjoyed the most popular appeal. Opinions on choice of toys are found in such magazines as Ladies Heme Journal and Parents Magazine.

(a) Toy purchases

In the area of toy purchases much has been written on the toys which best perform certain needs of the child. Kawin (14) has set up a list of good toys for the various age groups also pointing out the specific function in child growth which each toy, or group of toys, will develop. Miss Kawin classifies the toy functions into eight groups: strength and skill, constructive or creative play, dramatic or imitative play, social development, artistic development, knowledge toys, science or mechanical, and hobbies.

The Merrill-Palmer school (23) has recommended a list of toys for special age groups which would serve as an aid in the purchasing of childrens toys.

Lehman (18) ranked in order of preference the play activities liked best by beys and girls below the third grade level. Among the boys the first six choices in order of preference were: playing with balls, blocks, and wagons, playing house, riding a horse, playing hide and seek; reading was

last in the group of twenty-five activities. In the girls' first six choices were: playing house, dolls, school, hide and seek, tag, and playing with balls. For this group reading was eighteenth out of twenty-five. In a similar study done by Lehman of a gifted group of boys and girls the best liked activity was reading books.

The Masters thesis written by Carrie McLain of Michigan State
College (22) presented the views of a group of Lansing (Michigan) mothers
concerning care for the Preschool child in the home and their attitudes
toward Hursery schools. Miss McLain found the most popular children's
toys, as reported by the Mothers, to be those concerned with motor activity
such as wagens, tricycles, and sleds. Housekeeping toys and dolls rated
second. The above author found a lack of interest on the part of the
Mothers interviewed in toys for "building and making things." An apparent
disinterest was shown in the provision of social opportunities, toys, and
aesthetic materials suitable for children. Tew of the Mothers were conscieus of the child's needs for supervised play.

According to Garrison (9) toys are the tools of play, the materials by which a child learns. To this author play materials are: miniature reproductions of adult life objects, skill toys, toys for the creation of useful and beautiful objects, or aesthetic, artistic or literary. The best play materials for a child should (1) stimulate self-activity, (2) reach the child at his own level of development, (3) be good looking, (4) be of good workmanship, (5) sanitary, and (6) be chosen for both cooperative and self play.

Louise Homer (13) has found that the best toys help to build personality, develop good habits such as self-reliance and taste, and also give pleasure. Good toys have several points in common. They are always the right size for the child, teach rhythm and coordination, are safe, and

lastly are wisely selected considering the childs interests and abilities.

Arlitt (3) writes in agreement with other authors that a child's toys must be chosen for durability rather than detailed perfection since they must withstand a variety of conditions in everyday play.

Catherine Landreth, in her book, "Education of the Young Child"

(17), emphasises the need for a variety of motor activities, therefore she recommends toy purchases which would lead to such activities as running, jumping, pushing, hitting, hammering, etc. She also states that if a young childs skill development is to follow a pattern of progressive development the equipment furnished him must challenge him to gradual increase of muscular action and coordination.

Value of toys having to do with housekeeping activities. Such equipment provides both play and practical interest for the child.

Lamberts' "School's Out" (16) shows the value of toys for dramatic play in stating that this type of play is as important a part of the childs development as is physical play. To Lambert dolls are of great significance as they help children dramatise their own personal situations.

Apparently there has been sufficient interest on the part of both educators and parents in the area of toy purchases to have brought about some research in the field.

The above mentioned anthors are in general agreement that toys serve a vital function in a childs life and should be wisely selected to fulfill the childs needs and interests.

(b) Purchasing of Household Furnishings

The purchasing of household furnishings is related to the children in the family. If furniture is to withstand the varied uses it is put to in

a day of child's play consideration must be given to its durability.

The White House Committee on Furnishings and Equipment (28) stated that if a child is permitted to help pick out the furniture it creates in that child a sense of both personal and family pride. Equipment should be selected for durability, attractiveness, comfort, and convenience -- the best quality that you can afford.

(c) Purchasing of reading materials

Children should be encouraged to value books and to care for them.

These provided in a child's library should be choosen for a definite purpose. The White House Committee (28) stated in a study of childrens books that they should be sturdy and written about things with which the child is familiar. Inexpensive books fill a temporary need.

Lindquist (20) reports that family books and magazines are often useful to the child who is learning to read.

It is recommended by Arlitt (3) that good children's books should contain no gruesome pictures or stories which will make the child afraid.

They should be simple stories of everyday life.

Geodspeed and Jehnson (11) find that picture books made with heavy cardboard pages are more easily manipulated by a child's tiny fingers than are cloth pages.

Clara Lambert (16) recommends providing children with some of the fine juvenile literature produced today along with the classics. Such popular material should have good print, artistic illustrations, and suitable content. Books provide not only a wealth of factual material on a great variety of subjects but also stories with historic or present-day settings.

Garrison and Sheehy (10) provide in their book a list of book selections classified as to type of subject matter. According to this test the childs interests in stories can also be met by words of songs, nursery

rhymes, personal experience stories told to him, and picture books which provide the basis for story telling. Books have their place in the childs experience but they never take the place of the told story. It is the responsibility of parents to see that the childs library grows; that good books are provided, and that responsibility for the care of books is learned at an early age.

Books, according to Landreth (17), open a new world for the child; they enrich his experiences, increase and unify his knowledge, develop humor, imagination, and sympathy, offering experiences which life itself could not provide. Book construction is of the upmost importance if they are to serve the childs needs. Investigation and general observation, states Miss Landreth, indicate that books greater than eight inches square are not easily handled. Bull-surfaced, tough paper, either saddled sewn or stapled together is most practical for free handling. A washable cover also adds to the life and enjoyment of the book.

Alsohuler (1) writing on the general type of books for the pre-school child lists for the two and three year old stories about themselves in a simple literary style; for the older three and early four year olds stories about babies, moving things such as cars and trains, or books about animals. Older four year olds have more objective interests, they enjoy watching men doing things therefore information stories are valuable for this age child.

Dorothy Baruch (4) stated four criteria usable in the selection of books for children:

- (1) Will the story interest the child?
- (2) Is the story understandable?
- (3) What effect will the story have?
- (4) Does the story have literary value?

Certainly careful consideration of these criteria would eliminate the use of

many of the worthless childrens books which have in recent years flooded the beak market and provide children with good books.

The reading material purchased for a childs use should be given considerable thought, not just bought by name or looking to see whether or not the pictures are colored.

A child needs good books. Some for stories of simple everyday life, some of the classics, an occasional picture book to encourage story telling, and many books of varied subject matter to introduce new and unusual experiences in the childs life.

(d) Methods used to prevent misuse of toys and furnishings

Lindquist (20) in her studies of Home Management has found that the provision of a place for everything is the first step in teaching orderliness to a child. Respect for the property of others is learned from the ownership of a limited number of cherished articles which are kept by the child.

Gertrude Chittenden (6) writes that family happiness and safety will be much better if a child has a place for his toys which is conveniently reached and spacious enough so that the toys are put into it easily. They must of course be taught to put them away in the space provided by themselves.

Goodspeed and Johnson (11) suggest a lew cupboard, box, shelf, or corner of a room be given to the child for his belongings. He should be taught to put away anything he takes out. Patient help from the parents is needed for this training.

While a child is learning to care for his own belongings he will also learn to respect the toys of other children.

(e) Amount of time spent on child care and training by family members Ruth Lindquist (21) in her studies of Family L_1 fe found that about

four and one-half hours per day were spent in care of family members which would include: dressing and bathing children, teaching, and supervision.

Lindquist (21) also found that the care of younger children was often given to older brothers and sisters, particularly if there were three or more children in the family. The fathers also contributed some time to child care.

The White House Conference study (28) showed that in homes of higher social status the father spent more time in playing with the children than was found in lower economic level homes.

Kyrk in the book "Economic Problems of the Family" (15) reporting the time spent on various Homemaking activities found that the average time per week spent on child care for farm families was 4.6 hours while town families spent 8.0 hours. The above figures were based on unpublished data from the U. S. bureau of Home Economics.

Nickell and Dorsey in charting the Homemakers work week credit farm homemakers with spending 3 hours and 55 minutes on child care while other rural homemakers spend 4 hours and 43 minutes. In the case of farm families the time was found to be 8 percent of the working week spent on child care. In a study of the effect of family composition on child care the following figures were obtained (24):

Composition of Family	Hours per week for Child Care
Youngest child under 1 year	21
Youngest 1 - 2 years	10.5
Youngest 3 - 5 years	5.8
Youngest 6 - 9 years	3. 5
Youngest 10 - 14 years	1.5

These figures are also based on unpublished material from the U. S. Bureau of Home Economics.

Management found that the average amount of time used during the week for care of family members amounted to twelve hours. As the age of the youngest family member increased the time spent on child care decreased. Evidence indicated that families with more than one child spent about the same amount of time in child care as did families with one child, less time must therefore be spent for each child. Miss Warren's interpretation of this is that in all probability in cases where there is more than one child the older children helped with the care of the younger ones and that this time was not estimated by the home-makers.

GENERAL FINDINGS

The statistics collected for this thesis, involving the relation of certain factors in Home Management to the presence of children in the family, present certain factors of general significance.

In the area of toy purchases three classifications (according to Kawin) rated high. These were:

- a. Strength and skill 266 purchases.
- b. Branatic and imitative 233 purchases.
- c. Social development 207 pur chases.

The other classifications showed a much lower incidence of purchase.

Floor covering leads the list of purchases of household equipment made with durability in mind because of the presence of children in the family. This was followed by chairs and thirdly davenport purchases.

The section on reading material indicates a wider use of books than magazines regardless of any of the management factors studied.

An overwhelming majority of the families interviewed use the provision of a storage space for toys not in use as the most effective way of preventing the misuse of toys and furnishings.

A review of the material on time spent by family members on child care shows in all instances the mother contributing the greatest number of hours toward child care, training, and guidance.

A. THE FACTOR OF ECONOMIC LEVEL

By means of a schedule, used in interviews with homemakers, an attempt was made to determine what relationship exists between certain factors involved in Home Management and the presence of children in the home.

The relationship of economic level of the family to toy purchases, durability of toys, purchases of household furnishings, purchasing of reading material, methods used to prevent the misuse of toys, total time spent on child care, and the time spent on child care by individual family members will be considered in this section.

Classification of Toy Purchases:

The classification of toy purchases according to the type of development which they affect shows striking similarity for all economic levels.

Low level families for both age groups showed their highest purchases to be dramatic and imitative toys followed by social and strength or skill toys.

Nost frequent purchases for medium and comfort level families, regardless of age groups, were strength and skill toys followed by dramatic or imitative and social toys. See Table I.

Families with children five to sixteen years of age recorded a rise in frequency of total toy purchases with a rise in economic level (3.46 - 3.62 - 4.25). Families with young children did not. The only single classification which followed a similar pattern was the frequency of purchases for constructive and creative toys.

In the age group birth to five years comfort level families had the highest total frequency of toy purchases (4.33) followed by low level with a 4.14 and lastly medium level families (3.76). A rise in economic level brought

⁽¹⁾ See Kawin classification on page 8.

PREQUENCY INDEX OF TOY PURCHASES CLASSIFIED ACCORDING TO THE TYPE OF TOY AND ECONOMIC LEVEL OF THE FAMILY. TABLE I.

	••	•

Total frequency	414	3,76	4. 33	404	: : 3,46 :	3,62	. 4.25	3,78

a rise in the frequency of purchase for strength and skill, constructive or creative, and science and mechanics toys. Social toys were purchased at the same frequency (1.09) by both low and medium level families with approximately the same for comfort level (1.08).

The only case in which no purchases were recorded was the science and mechanics group on low level for birth to five year olds.

Durability of Toys Purchased:

The durability of toys purchased by families with children in both age level groups showed an increased percentage of sturdy purchases with a rise in economic level. Families on medium level showed a variation of approximately 8 percent (53.8 percent sturdy and 46.2 percent fragile) for older children; in the younger age group the purchases were evenly divided. Comfort level families bought about 10 percent more sturdy than fragile toys for younger children and in the five to sixteen year group there was a 25 percent variation in favor of sturdy toys.

The total toy purchases for the birth to five year old children recorded 50.9 percent purchase of fragile toys against 49.1 per cent for sturdy; practically no variation. For families with children five to sixteen years of age there was a variation in purchase of 16 percent in favor of sturdy toys. This is a significant difference. See Table II.

Purchases of Household Furnishings:

The small number of household furnishings which were purchased with a view to the needs of children indicates a general lack of awareness of the need for durability because of the presence of children in the family as a factor in buying.

In both age level groups the highest frequency purchase of durable furnishings was reported by comfort level families (.62 for families with

younger children and .42 for the group with older children.) Jamilies with children five to sixteen years of age showed an increase in frequency of purchases, with consideration to durability, with a rise in economic level. The above is not true for families with children birth to five years of age. Nedium level families report the least awareness of durability with a frequency of purchase of .38. This was followed by low level families (.42) and lastly comfort level families. See Table III.

Selection of the floor covering rated highest in both age groups.

Families with younger children indicated the use of linoleum rugs while

families with older age level children mentioned only the rug with no explanation as to kind. Choice of the davenport ranked second with the older

group while families with small children rated second in consideration the

purchase of chairs. See appendix page

Purchasing of reading material:

In all cases, except comfort level families with children five to sixteen years of age, there was reported a higher frequency of book purchases than magazines.

The total frequency of purchase rose with economic level for families with elder children (.17 low, .38 medium, and .45 comfort). This appears a decisive variation although the total number of purchases reported was small. Families with children birth to five years of age did not show consistent variation in purchases (.39 medium, .35 comfort, .26 low).

The frequency of book purchases increased with economic level for the younger group but the differences were slight (.42, .47, .51). See Table IV.

"Boys Life" was the most frequently mentioned magazine for older children. Comfort level families reported six of their twenty-five purchases

to be the above magazine. "Jack and Jill" was reported purchased three times out of five on comfort level in the younger group.

Two encyclopedias were purchased by families in the younger age group, one each on medium and comfort level. In the five to sixteen year group one comfort level family reported the purchase on an encyclopedia. See appendix page

Methods Used to Prevent Misuse of Toys:

Providing a storage space for toys when they are not in use was the most frequently mentioned method for the prevention of the misuse of toys regardless of economic level.

Low and medium level families with younger children reported their second choice of method the taking of toys away from the child when they were not being used correctly. Comfort level families listed as their second choice showing a child how to play with the toy.

Families with children five to sixteen years of age on low economic level reported the same second choice as the younger group. Medium and comfort level families use the wise choice of toys which can be freely used by the child as their second most popular method. See Table V.

Total Time Spent on Child Care:

The average time per day spent on child care for all economic levels with children in the birth to five year age group was 6.35 hours; the average for the five to sixteen year group was considerably lower at 3.47 hours. See Table VI.

In the younger age group a rise in economic level brought a rise in the amount of time spent on child care beginning at 5.71 hours for low level families, increasing to 6.49 hours on medium level, and 6.82 hours for comfort level.

•• •• ••	: To tal		•• •• ••	705,25	•• •• ••	; !!!!	6.35 hrs.	361.58	: 104	. 8.47 hrs.

The age group five to sixteen years did not show as great variation in the number of hours, nor did an increase in economic level carry with it an increased amount of time consumed in child care. Families on medium economic level spent a greater number of hours for child care, 3.59 hours per day per family, this was followed by 3.46 hours on comfort level and 3.37 hours for low level families.

Time Spent On Child Care By Individual Family Members:

Giving consideration to the time spent by the individual family members on child care for families with children birth to five years we find that a rise in economic level indicates a rise in the number of hours spent by both mother and father. The time spent by Mothers is quite naturally highest averaging from 4.80 hours for low level families to 4.94 hours on comfort level. In this age group there was some indication of help from older siblings and maids on medium and comfort level. See Tayle VII.

Families with children five to sixteen years show the Mother spending more time on child care at medium econonic level (2.53 hours per day), fellowed by comfort and low levels. Fathers from low level families reported the most time (1.36 hours) followed by 1.13 for comfort and 1.08 hours for medium level families. Older siblings on all economic levels in this age group spend more time than the Fathers in child care, but the number of cases reported is not sufficient to give comparable results. There were no cases reported of assistance in child care, training, and guidance at the older age level by maids or sant's and uncles.

B. THE FACTOR OF FAMILY RESIDENCE

The following section shows the relationship of the location of family residence to the factors of toy purchases (including durability), purchases of household furnishings and reading material, methods used by families to prevent the misuse of toys, and the time spent on child care.

Classification of Toy Purchases:

The total toy purchases in their relation to residence showed no striking variations. Total frequency of purchases for the birth to five year group was highest for farm families at 4.26 followed by village families 3.91. In families with children five to sixteen years the opposite was true, although the variation (.21) was not significant. See Table VIII.

Farm families in the lower age level group reported a higher frequency of purchase than village families for all classes of toys except science and mechanics and artistic.

Families with children five to sixteen years reported a higher frequency of toy purchase by village families for all cases except social and constructive or creative. An explanation of these exceptions might be the facilities provided by the school and community.

Durability of Toys Purchased:

The effect of residence on the durability of toys purchased showed only slight differences for families with children birth to five years of age. More sturdy toys were reported purchased by farm families. Village families bought more fragile toys but the difference in percentage was slight (3.8 percent). The total purchases for this age level showed a 50.9 percent purchase of fragile toys which was 1.8 percent higher than the sturdy toys purchased.

TABLE VIII. PREQUENCY INDEX OF TOY PURCHASES CLASSIFIED ACCORDING TO THE TYPE OF TOY AND RESIDENCE OF THE FAMILY

Type of development affected:	: Childre	12	260	Ch1	Children 5-16 years of age	s of age

Social	1,14	1.05	1.09	88.		F.
Artistic	4 0.	60°	20.	80.	.16	.12
Stimulate knowledge	-14	900	60.	. 22	33.	62•
Science and mechanics	1	90	800	& & & & & & & & & & & & & & & & & & &	90	4 0•
Total frequency	: 4.26	3.91	4. 04	3.68	3.89	3.78

Families with children five to sixteen years of age show a higher percentage of purchase of study toys for both residence groups. The total purchase of study toys was 15.8 percent higher than for fragile toys. This would appear to be a conclusive difference. See Table IX.

Purchases of Household Furnishings:

Residence apparently had some effect on the awareness of durability in the purchasing of household furnishings. In both age level groups the village families reported a higher frequency of purchase in which durability, because of the presence of children in the family, was a factor affecting their choice. The differences were small but there similarity in trend is worth noting. Village families had a higher frequency of purchase by .16 for the younger age group and half that number (.08) difference for families with children five to sixteen years old. See Table X.

These frequency numbers indicate that less than half of the families actually considered their children when buying household furnishings.

Purchasing of Reading Material:

The effect of residence on the purchasing of reading material was evident in that village families report the highest frequency of purchase for both books and magazines at both age levels. See Table XI.

Book purchases for both age levels by village families were about one to every two families. Magasine purchases for the younger age group were quite naturally low (.11 frequency); village families in the older age level group reported a .41 frequency of purchase.

The encyclopedia purchases on both age levels were recorted by village families. See appendix page.

Methods Used to Prevent Misuse of Toys:

The method most frequently used to prevent the misuse of toys regardless of the place of residence of the family was the provision of a storage space for toys when they were not in use.

Farm families for both age groups ranked as their second method the wise choice of toys which could be used freely by the child. Village families for both age groups placed second showing the child how to play with the toy. In the case of village families with children five to sixteen years of age the percentage for the above mentioned method and the choice of toys was identical.

Taking the toy away from the child when it was not being used correctly was rated low by both age groups regardless of residence. See Table XII.

Total Time Spent on Child Care:

The total time spent on child care varied slightly with the place of residence.

Families with children birth to five years of age living on farms remorted an average time per family of 6.21 hours per day. Village families averaged 6.47 hours.

Farm families with older age level children spent 3.22 hours per day on child care with village families averaging 3.69 hours.

The preceeding data would indicate that residence is not a factor which vitally influences child care. See Table XIII.

Time Spent on Child Care by Individual Family Members:

Breaking down the total time spent on child care to determine the average time spent by various family members indicates some differences between the residence groups.

The time spent by village fathers was less on both age levels than for farm fathers. Exactly the opposite was true for the mothers. Farm mothers spend less time on child care, training and guidance. These facts are in agreement with the statement made by Nickell and Dorsey in their book "Management in Family Living" (p. 59) in which they state that urban homemakers spend more time on child care than rural women.

Older siblings were reported spending some time on child care by both age groups. The number of cases reported was small and would not be comparable to the average hours of other family members. See Table XIV.

C. THE FACTOR OF PARENTAL EDUCATION

In this section is included not only the relationship of average parental education to the various factors involved in Child Development but also the relationship existing between some of these factors and the Home Economics training of the Mother. The types of Home Economics training were grouped as Formal, Extension, Extension and Formal combined, and no training.

Classification of Toy Purchases:

The effect of parental education in its relationship to toy purchases was more noticeable in the age group five to sixteen years. In this group an increase in the average years of parental education increased the frequency of total toy purchases. The group with 16.5 years or more of education remorted a frequency of 4.66 compared with 3.56 for families with eight years or less of schooling. Strength and skill toys rated highest in purchases for the first three educational groups at this age level, with dramatic and imitative highest for the 16.5 years or more group. This last figure was based on three cases, not a sufficient number upon which to draw any comparisons. See Table XV.

Families with children birth to five years of age showed no pattern of toy purchases in relation to education. Families with 8.5 to 12 years of schooling reported the highest total frequency of toy purchases (4.29). The lowest group were the college trained parents with a frequency of 3.52. Most frequent purchases by toy classes and educational groups for the birth to five year level were as follows:

TABLE XV. FREQUENCY INDEX OF TOY FUNCHASES CLASSIFIED ACCORDING TO THE TYPE OF TOY AND PARENTAL EDUCATION

Total frequency	411	. 4.29	8 52 8 52	4.23	 4.04:	3.56	3,78	3.91	4.66	3.78

Parental Education	Most Frequent Class of Toys
8 years or less	Dramatic or imitative
8.5 - 12 years	Social
12.5 - 16 years	Strength and skill
16.5 or more	Soci al

It is interesting to note that for both age level groups the families with eight years or less of education reported no purchase in the science and mechanics toy classification.

Top toy purchases for the two age levels were as follows:

Parental Education	0 - 5 years	5 - 16 years
8 or less	Stuffed animals, cars, trucks, tanks	Dolls, balls
8.5 - 12	Dolls, wagon	Dolls, skates
12.5 - 16	Dolls, play house equipment	Dolls, skates
16.5 or more	Dolls, play house equipment, blocks	Bicycle

Durability of Toys Purchased:

The percentage of sturdy and fragile toy purchases showed only slight relation to the average years of parental education. Families with dhildren birth to five years of age showed more fragile toys purchased by the first two educational groups (61.7) percent for eight years or less and 51.6 percent for 8.5 - 12 years). More sturdy toys were purchased by the other two educational groups (52.4 percent and 57.5 percent). There was an increase in sturdy toy purchases with a rise in years of education at this level.

A higher percentage of fragile toys was purchased by families with eight years or less of schooling having children in the older age group. The two middle groups (8.5 - 12 and 12.5 - 16) showed more sturdy purchases.

Families in the class 16.5 years or more of education were divided equally on their toy purchases. See Table XVI.

Purchases of Household Furnishings:

Families in the age group birth to five years indicated a definite rise in the purchasing of durable household furnishings with a rise in the average years of parental education. The frequency of durable purchases varied from .25 for the group with eight years or less of formal education to 1.62 for families with an average of 16.5 or more years of school.

In the older age level the distribution of purchases did not appear related to education. No cases were reported by the highest educationally trained group. Two groups (8 years or less and 12.5 - 16) were identical in the frequency reported and the high school level group was highest with a frequency of .48. See Table XVII.

Purchasing of Reading Material:

Total purchases for reading material showed a rise in frequency, by the five to sixteen year group, with a rise in years of education until the last group (including only three cases) which had a definite drop. For the families with children in the younger age group the highest frequency of purchase was recorded by the 8.5 - 12 year group followed by the 12.5 - 16 year group, and lastly the same frequency was reported by the remaining two groups. See Table XVIII.

Book purchases for both age levels rose in frequency with education until the highest groups which in both cases dropped back.

Magazine purchases showed no definite pattern of purchase. The highest for the low age level group was the 12.5 - 16 group and for the families of five to sixteen year olds the highest frequency was reported by the 16.5 or more level.

Method Used to Prevent Misuse of Toys:

For all educational groups the highest percentage of use for the methods listed in the prevention of the misuse of toys was the provision of storage space for toys not in use. The percentage among older age level families were much more decisive in favor of the above method than those in the birth to five year group.

Families with eight years or less of education in the birth to five year group reported a more even distribution among the four methods suggested than was found in any other educational group. See Table XIX.

Total Time Spent on Child Care:

Parental education is apparently not a specific factor, in this study, in influencing the total amount of time consumed daily by families for child care. The only similarity notedwas that the greatest amount of time per day was spent by families in the highest educational group. Of families with young children those with 8.5 - 12 years of education ranked lowest in the time spent on child care; secondly was the 12.5 - 16 year group, and thirdly the families with eight years or less of education. This indicates no relation between total time spent on child care and parental education.

Older age level childrens families rated from low to high the following groups: 8 years or less, 12.5 - 16, and 8.5 - 12. This list follows more nearly what you might expect. See Table XX.

Time Spent on Child Care by Individual Family Members:

Relating perental education to the time spent on child care by the individual family members showed no set pattern of time usuage. See Table XXI.

Fathers with birth to five year old children who had 16.5 or more years of education spent the most time on child care. The opposite was true for 5-16 year old childrens' fathers in the same educational group.

Lowest in the younger age level were fathers in the 12.5 - 16 year group.

Mothers, with young children, whose education falls in the eight year or less group spent the most time on child care; the least time was spent by women in the 8.5 - 12 year classification. On the older age level the most time was consumed by Mothers in the 16.5 or more group and the least by women in the eight year or less class.

There was greater assistance from other family members in the 8.5 - 12 group with younger children than was noted in any other group.

HOME ECONOMICS TRAINING

Classification of Toy Purchases:

Among families with children birth to five years of age the highest frequency of toy purchases (4.63) was reported by the group in which the Mother had Extension training in Home Economics; following this group were those having had Formal training (4.04), third Mothers with no Homemaking training, and lastly were families in which the Mother had both Extension and Formal Home Economics work.

Extension trained women showed a higher frequency of purchases in two areas, that of dramatic or imitative and social toys. Families in which the Mother had no Home Economics training bought more strength and skill toys than were purchased by other families.

In families with children five to sixteen years of age the highest total frequency of toy purchases was reported by the group with both Extension and Formal training (4.34), following, in the order mentioned, were the group with Formal training (4.06), those with no Home Economics training (3.86), and lastly women with Extension training (3.15).

Women having had Extension and Formal training bought more strength and skill toys, constructive and creative, knowledge toys, and also social toys. Families in the class in which the Mother had only Formal Home Economics training rated highest in the purchase of dramatic or imitative and artistic toys. See Table XXII.

Durability of Toys Purchased:

The percentages were exactly the opposite for the durability of purchases made by families for any given gype of Home Economics training in the two age groups. Families in the birth to five year group bought more stardy toys only in the group in which the mother had formal training. In

the five to sixteen year group more fragile toys were purchased by one group, that in which the mother had Home Economics training through her formal education. See Table XXIII.

Purchases from the group with no Home Economics training in both age levels correspond with the total purchases recorded for the entire group.

In this particular area of child care H_0 me Economics training has apparently had little effect.

Purchases of Household Furnishings:

Families with children in the younger age level showed a definite relationship between Home Economics training and the purchasing of durable Household furnishings. Highest frequency of purchases was recorded by women with formal Home Economics training; the lowest was reported by women with no Homemaking training.

The five to sixteen year group showed no awareness of durability as a factor in household furnishings purchases. In this age level the women with no Home Economics training reported a higher frequency (.51); the lowest (.20) was by women with extension training. See Table XXIV.

Purchasing of Reading Material:

The total purchases of reading material by non-Home Economics trained women were second in the younger age group following the Extension trained women. Families with children in the older age level in which the Mother had no Home Economics training reported the lowest frequency of purchases. Highest purchases were reported by woemn who had both Formal and Extension training. The value of the reading material purchased was not estimated.

Book purchases for women with Formal Home Economics training were highest in the older age level. In the younger group Extension trained women placed highest in books purchased followed by no training in Homemaking.

There were an equal number of magazines purchased in the bith to five year old homes by non-Home Economics trained and Extension trained women. Highest magazine purchases in older age level were reported by women having had formal and extension training; lowest by women who had no Home Economics training. See Tabel XXV.

Methods Used to Prevent the Misses of Toys:

In all cases the provision of storage space for toys when they are not in use rated highest of the methods suggested to prevent the misuse of toys. Women with children in the younger age group having no Home-making training reported their second choice the method of taking the toy away from the child. Home Economics trained Mothers at this age level used secondly the method of showing the child how to play with the toy. This response may reflect to some extent their Home Economics training.

In three of the four classifications among families in the older age level group the wise choice of toys ranked second in use; the fourth group (those having had extension training) rated showing the child how to play with the toy as second. See T-ble XXVI.

Total Time Spent on Child Care:

Families in the age group birth to five years in which the Mother had no Home Economics training reported the most hours per day consumed in child care (6.84). Lowest number of hours reported was 6.01 by women with formal Homemaking education. Does this indicate that some types of formal education apparently stress methods which decrease the time needed for physical care? It is to be hoped that the time spent in training and guidance is not decreased to any great extent.

Older age level childrens families report the most time spent on child care by those women who had formal training and the least time by extension trained wamen. See Table XXVII.

Time Spent on Child Care by Individual Family Members:

Comparing the time spent on child care by individual family members and the Home Economics training of the Mother the greatest amount of time, for families with young children, was reported by mothers with no Home Economics training (5.61 hrs.). The least time was spent by women who had both Extension and Formal training (4.66 hrs.).

Husbands of Extension trained women spent more time on child care (1.91 hrs.) than was reported by other groups; lowest time recorded for fathers was 1.20 hours by both Formal and non-Home Economics trained women. See Table XXVIII.

Families with children five to sixteen years of age showed Mothers with Formal Home Economics training spending the most time on child care (2.52 hrs.) followed by non-Home Economics trained (2.40 hrs.), Extension and Formal training (2.26 hrs.), and Extension trained with the least time (2.22 hrs.).

Fathers of older children reported less time spent on child care, training, and guidance. Fewer hours were reported by the group in which the wife had both Extension and Formal training (.92 hrs.) followed by non-Home Economics trained (1.11 hrs.), Extension trained (1.20 hrs.), and the most time reported by Fathers where the wife had Formal Home Economics training (1.45 hrs.).

The time contributed by other family members in all cases was slight and the number of cases reported was small.

D. THE FACTOR OF FAMILY SIZE

It has been written on numerous occasions that the number of children in the family has a definite influence on various factors in Child Development. The following section of this thesis shows some areas in which relationships were found to exist.

Classification of Toy Rirchases:

The factor of family size showed some influence on the purchasing of toys. In both age groups the percentage of purchases for social toys increased with an increase in family size. For families with children five to sixteen years of age the percentage of darmatic and imitative toys purchased also increased with family size.

Families in the birth to five year group with more than one child reported their highest purchases as strength and skill toys. The group with one child purchased more dramatic and imitative toys.

Families with older children having one child and the group with two, three and four children reported more strength and skill toys purchased.

Families with five or more children at this age level showed a higher purchase of dramatic or imitative toys.

Greatest variation in purchases were noted in the older age group for toys classed as science and mechanics, constructive and creative, and those tending to stimulate knowledge. See Table XXIX.

The percentage of distribution among family size groups was more even in the lower age level families with the exception of the last two classifications (stimulation of knowledge and science or mechanics).

Top toy purchases by family size groups follows:

1	dolls, stuffed animals	skates, chinese checkers
2 - 3 - 4	dolls, play house equip-	dolls, skates
5 or more	dolls, stuffed animals	dolls, balls, truck-wagon

Durability of Toys Purchased:

The purchase of sturdy toys decreased with an increase in family size for older age level families, although in those families the total purchase of sturdy toys was greater than that for fragile toys. The family group with five or more children reported a larger percentage of fragile toys purchased.

Families with younger children having one child and those with five or more children bought more fragile toys. Two, three, or four children families purchased the majority of their toys in the sturdy class at the younger age level. See Table XXX.

Purchases of Durable Household Furnishings:

The frequency of purchase of household furnishings with consideration for durability showed an increase with a corresponding increase in family size (.15 to .32 to .81) for families with older age level children. No definite increase was noted in the younger group except from the low frequency for only children (.14) to (.63) for families with two, three, or four children. It did not follow, as one might expect, that there was an increase in consideration of durability for the largest families. See Table XXXI.

Purchasing of Reading Material:

Highest percentage of book purchases for the younger age level was made by families with five or more children but the proportion of purchases decreased with an increase in family size. In the five to sixteen year

group an increase in family size brought an increase in book purchases for the first two groups. See Table XXXII.

Magazine purchases rose 16.3 percent from two, three, or four children families to those with five or more at the younger age level. For five to sixteen year old children the magazine purchases showed only slight variation with family size; no purchases were reported by families with five or more children.

In both age level groups the encyclopedias were purchased by families with two, three, or four children.

Methods Used to Prevent Misuse of Toys:

Following a pattern similar to all of the previously studied factors family size groups rated number one of their methods used to prevent the misuse of toys the provision of storage space. Second among families with one child for the lower age group was showing the child how to play with a toy. Both of the larger family groups at the lower age level placed second taking the toy away.

Families with children five to sixteen years of age with one child rated second taking the toy away. Larger families practiced the policy of wise toy choices for free use by the children. Families with five or more children rated equally the above mentioned method and taking away the toy. See Table XXXIII.

Total Time Spent on Child Care:

Both age level groups indicated an increase in the total amount of time spent on child care with an increase in family size. The increase however was not sufficient to allow the same time per child in the larger families as was given to only children. It might be concluded that many tasks take the same amount of time for several children as would be expended for one child. See Table XXXIV.

Time Spent on Child Care by Individual Family Members:

The amount of time spent by the Mothers of five to sixteen year olds increased with an increase in family size, however, the time per child decreased. For the younger children more time was spent by Mothers with one child than was indicated by women with two, three, or four children.

The greatest number of hours spent by fathers with young children was reported by the group with two, three, or four children. In the older age level fathers with five or more children spent the most time on child care. See Table XXXV.

Older siblings shared only to as light extent the responsibilities of child care according to the cases reported.

Since the time for all family members was estimated by the Mothers it is possible that the amount of time given to child care by the other family members was not accurately recorded.

SUMMARY

This study concerns the effect of certain factors in the home related to child development: toy purchases, the purchasing of durable household furnishings, purchasing of reading material, methods used to prevent the misuse of toys, and the time spent on child care. The data analyzed are a part of the larger study of 382 Michigan homes made at Michigan State College.

In this smaller study a group of 222 families were considered. They were divided into two groups for purposes of comparison, one group having children up to five years of age and the other group, families with children five to sixteen years of age. The factors, mentioned earlier, were analyzed in their relation to economic level, place of residence, parental education (including Home Economics training of the Mother), and family size.

The factors selected for analysis in this study were chosen because of the relationships it was hoped would be found between certain home management practices and the presence of children in the family. The factors of family size and age of family members in their relation to some management practices has been the concern of educators in the past. This study brings to light the relationships which exist in Michigan homes between certain of the management practices and five specific items related to child development.

(A) Economic level

The effect of economic level on the factors studied showed varied results. For the younger age group a positive relationship existed between a rise in economic level and the increased purchase of strength and

constructive toys, the durability of toys purchased, the increase in purchase of books and magazines, and the time spent in care and guidance of children.

Families in the older age level group showed a positive relationship with a rise in economic level in five of the ten factors studied. The correlated factors were: frequency of toy purchases, three types of toys (strength, dramatic, and social), durability of toys, and books and magazines purchased.

An analysis of this factor showed a greater relationship existing between economic level and the specific items relating to families in the younger age group than was found on the same items for families with children in the older age group.

(B) Residence

For families with children in the younger age group there was a higher frequency of toy purchases for farm families than village families. Similarly farm fathers were reported to have spent more time in child care and guidance. Village families ranked higher in books purchased, purchasing of durable household furnishings, the time spent by the Mother on child care and guidance, and slightly higher in total time spent on child care.

For families in the older age level group the results were similar.

Agein farm families ranked higher for the time spent by Fathers in child care. Village families were higher in five of the items analyzed - frequency of toy purchases, book and magazine purchases, purchasing of durable furnishings, and the total time and the Mother's time given to child care and guidance.

According to the above results village children apparently had an advantage at both age levels.

(C) Parental education

A rise in the average years of perental education for the younger age group brought a corresponding increase in: sturdy toys purchased, books purchased, and in consideration of durability as a factor in the purchasing of household furnishings.

With families of children in the older age group a rise in years of parental education correlated with an increase in the frequency of toys purchased and the purchasing of books.

General education is apparently not a factor which increases markedly the effectiveness of the particular management problems analyzed in this study.

Home Economics education

out what Home Economists might hope for. The highest frequency of toy purchases for families with children up to five years of age was reported by women with Extension training in Home Economics; the lowest by women with both Formal and Extension Home Economics. In families with older children the highest frequency of purchases was reported by women with both Extension and Formal training; the lowest by Extension trained women. The percentages for durability of toy purchases were exactly the opposite for families with identical training but whose children were in different age groups.

The purchasing of durable household furnishings was apparently not affected by the Mother's Home Economics training. For families with children in the younger group those with Formal Economics training bought more durable furnishings; in the older group non-Home Economics trained women showed more consideration of durability as a factor in selecting household furnishings.

Home Economics education showed some relation to the purchasing of reading material, the methods used to prevent the misuse of toys. Non-Home Economics trained women with young children spent more time in child care, training, and guidance, perhas indicating that Home Economics training made its possessors slightly more effective in their use of time.

(D) Family size

The factor of family size was positively related for younger age level families of toys purchased, the purchasing of social toys, the reading material purchased, and in the total time spent in child care and guidance. In the case of toy purchases and books and magazines purchased the increase was for the family as a whole and was not sufficient to show an increase per child.

Older age level childrens families showed a relationship existing between an increase in family size and frequency of toys purchased (specifically social and dramatic toys), the purchasing of durable household furnishings, total time spent in child care, and the time spent by the Morther on child care and guidance. The same exception was encountered at this age level regarding the frequency of toys purchased - the increase was per family and not per child.

CONCLUSIONS

· This study indicates a need for giving information to Michigan families which would bring about the selection of a greater variety of toys.

The lack of response concerning the purchasing of durable house-hold furnishings would lead one to believe that an awareness of their place in Child Development is not felt.

The overwhelming response for the provision of storage space for toys when they are not in use is gratifying. It is hoped that the families are aware of some of the other values obtained from the use of this method such as: respect for the property of others, the feeling of ownership, tidyness, etc.

The time spent in care of children by this particular group of Michigan women was considerably higher than has been reported by other authors.

		Name your shopping center for How many miles distant?
VII.	goc	sewife's Incentives for conscious management of time, energy, income, is and services. Efficiency. Belief in most efficient method of working Desire for more leisure time for housewife To conserve energy To reduce expenses of running a home To enjoy more social life - either within or without the family circle which one? To improve the home artistically To be able to participate more fully in community affairs To make home living more satisfactory To have more time for earning money Because of poor health, energy is limited

PART II.

MANAGEMENT AS APPLIED TO THE HOME

I. MONEY MANAGEMENT

. Expenditures

I. Plan

Ъ•	How If 1. 2.	s your family have a plan for spending family income? YesNo long have you had such a plan?yrs. there is such a plan Form. WrittenUnwritten Completeness. PartialComplete Who makes the plan? Check one: aWhole family group. bFather & mother. cMother & father & older children. dFather. eMother fOther
	4.	Is there a regular time for making the plan? YesNo If yes, is it: aParticular time set for family council bWhen family happens to be together cAt meal time dWhen occasion arises to spend money eOther
	5.	Where is plan usually made? aIn living room bAround dining room table cAround kitchen table dOther
	6.	How is it made? a. Sources of Help lOwn expenditures of other years 2Printed budgets 3Others
		b. List of items to be included 1. Headings aMake own headings bFollow headings of printed book cOther
		2. Basis for including items in list aFamily custom bConsideration of needs of members of family cConsideration of long-time family plans dOther

3. Basis for setting a money valuation on each item:

a. ______Past experience
b. ______Inquiry at stores
c. _____Other___

c. Bringing budget into balance. When evaluated items are added and checked against income, -l. If income is larger than planned expenditures what is done with remainder?

			- 6 -
Α.	I.	Plan	(continued)
			2. If planned outgo is larger than expected income, - aIs number of items reduced? Name principal one?
			bIs cost of certain items reduced? cOther
			d. Basis of Making decisions 1. Calculation of needs. Long timeImmediate 2. Emphasis on aFarm or business needs bFamily needs cBalance between (a) and (b)
		d.	If no plan is made, 1. Who decides how much money shall be spent? aWhole family group bFather and mother with older children cFather and mother dFather eMother fOther
			2. Are decisions talked over with other members? Yes No If yes, with whom?
			3. When are decisions made? aAt time set for a family council bWhen family happens to be together cAt meal time dWhen occasions arise to spend money eOther
	II.	Con	trol of Family Money
		a.	Who controls the spending of family income? 1Mother 2Father 3Mother & father 4Father, mother and children 5Other
		b.	What arrangements are made for handling the income? 1Money given by one person on request 2Joint bank account 3Common purse 4Household allowances 5Personal allowances 6Other 7Does anyone in the family have a bank checking account?
В.	Say	vings	and Debts
	In	this	study, insurance is considered as a substitute for savings
	т	הים	the family plan to save duming the next warm? Yes

ın	tnis	study, insurance is considered as a substitute for savings
I.	a.	the family plan to save during the past year? YesNo If planned, did you save 1As much as planned 2More than planned 3Less than planned
	b.	If not planned, did the family save any money? YesNo

II. Who decides how much shall be saved?

a._____Whole family together

b._____Mother, father with older children

c.____Mother and father

d.____Mother

		of the a b c d	planning and executing methods of developing the personalities family members? By - _Family conversations gRadio _Reading books hDancing lessons _Definite theories of child training iDramatic lessons _Social contact with stimulating jMusic lessons personalities jMusic lessons personalities kNursery school _Sunday school lOther. State what

(Mark methods of first, second and third importance as well as all methods used.)

3.	Economic	Status

С.

I.	a b	e you had any definite plan to impRemodeling homeBuilding new homeBuying landBuying other property	rove the economic status of your family by, - eTaking out life insurance fOther
II.	If a.	you have such plans made, When were these plans made? 1 Before marriage 2 Married 0 - 4 yrs. 3 Married 5 - 9 yrs.	4Married 10 - 15 yrs. 5Married more than 15 yrs.
	b.	By whom were these plans made? 1Mother alone 2Father alone 3Father & mother	4All family 5Other
	c.	Have there been any changes in yo Yes No l. If yes, list changes: a b	
	d.	Were sacrifices made to carry out 1Mother 2Father 3Older son	the plan by 4Older daughter 5All family 6Other
	e.	If not who does not, and state re	Reason for not agreeing
	f.	Were there any other plans consid List 1. 2.	
	g.	Which plans have been actively be l	gun? List 3 4
II.	a. b. c.	Is property owned by husband and	wife as joint tenants? Yes No ness matters in order to be able to carry es No
Hea	1 th		
I.	whi	ch would improve their health? Mother 1	wing members of the family participate in c. Son over 14 yrs.
	b.	Father ·	d. Daughter over 14 yrs.

C. I.	Heal	th (continued)
	е.	Children 3 2 5
II.		n are members of your family examined by a doctor? Adult b. Children lWhen some illness develops 2At regular intervals 3. If so, when? 3. If so, when?
III.		n are teeth examined by a dentist? Adult 1When toothache starts 2At regular intervals 3. If so, when? 3. If so, when?
IV.	dis a	any member of the family ever used sera or vaccines to protect against eases, as - Diphtheria Smallpox Hay fever
٧.	hea	e you had any correction or elimination of defects which might be harmful to lth, done to any member of the family? Tonsillectomy
VI.	fol. a b c	e sacrifices made in order to secure better health for all the family by the lowing members of the family? Mother
D. <u>Spi</u>	ritu	al Growth
I.	Chu a.	Which members of your family - Person Hold membership in some church Contribute to some church 1. Mother 2. Father 3. Son over 14 yrs. 4. Daughter over 14 yrs. 5. Children
	b.	Church attendance Person Approximate No. of times attended per yr. Church services Sunday School Other church meetic. 1. Mother 2. Father 3. Daughter over 14 yrs. 4. Son over 14 yrs. 5. Children 6. Other
II.	Plana.	nning for certain types of spiritual development for the family -
	b.	Has the family within the last two years bought any object for its beauty alone? YesNo

. II.	Planning for certain types of spiritual development for the family (continued)
	c. Did you consider other uses for the money used for a & b? Yes No
	d. If yes, what were the other uses?
III.	Planning for the enjoyment of nature. a. Do you have a flower garden? Yes No
	Who plans and works in it? Person Who helps plan it? Who does the work for it?
	I. Wother alone
	2. Father alone
	3. Mother & father 4. Mother, father & children
	5. Older children
	6. Other
	b. Does the family take trips to notice scenery, wild flowers, wild birds, etc.? YesNo
	1. Are these trips planned especially for that purpose? YesNo
	2. Who plans the trips?
	aMother dAll the family Children
	aMother dAll the family bFather eChildren cMother & father fOther
	CO ther & rather
	nning for harmonious relationships in the family.
Ι.	What meals does the family have together? aBreakfast
II.	out of the house? YesNo
	b. Number of times the family meets other than at meal time, per month
	c. What is the purpose of these meetings?
	1Serious purposes
	2Just for fun 3Both
	4Do husband and wife plan to do things together just for fun? YesNo
	7 70 0 12 1 1 1 1 1 0 0 1 1 1 1 1 1 1 1 1 1
	d. If family gets together just for fun, does it spend any money to make these times more interesting? Yes No
III.	Does the family plan for vacations together? YesNo
	a. Do you own a summer cottage? YesNo b. Do you own a trailer? YesNo c. Do you rent either? SometimesOften
	b. Do you own a trailer? YesNo
	d. If you own neither of these, are you planning to own one? YesNo
	d. II you own neroner or onese, are you pranning to own one: lesNo
IV.	
	aSon 14 yrs. or over
	bFather fChildren
	aMother bFather fChildren cMother & father together dDaughter 14 yrs. or over hOther
	dDaughter 14 yrs. or overother
V.	Do all the members take a definite interest in these plans? YesNo
	If not, which member does not?
VI.	If the housewife's time is limited, in what ways does she plan to secure time for
	leisure with the family?
	aChanging standards of housekeeping b. Other members help with housework
	bOther members help with housework cOther
