ABSTRACT

THE MEANING OF MOVEMENT ON
THE CONTEMPORARY AMERICAN STAGE

by John C. Hurd

In spite of the opinion and evidence that movement
makes a far stronger impression on an audience than either
static pictures or sound, there seems to be insufficient
use of meaningful movement on the American stage today.
The purposes of this study, then, are first to rediscover
the heritage and the present state of theatrical knowledge
and opinion about the meaning of stage movement, and second
to derive principles and methods for taking advantage of
stage movement's powerful potential.

The sources studied are primarily writers and prac-
titioners from the theatre. They include certain selected
well-known and influential authors in the fields of stage
direction, motion pictures, television, dance, and pantomime.
The observations of the authors chosen are inductively com-
piled and compared according to subject, and, wherever
possible, harmonized to produce opinion norms of stage move-
ment meaning. Additional principles and illustrations are
derived deductively from the norms in order to complete any

gaps in the classifications.

The data from stage directing sources include such subjects as composition, picturization, gross blocking, fine movement of pantomime and business, the relation of movement to script lines, and the roles of audience predisposition and aesthetic or psychical distance in the reception of movement communication. The additional data derived from related theatrical sources by direct adaptation, by abstraction, and by analogy include such subjects as camera shots and montage sequences, live television's immediacy and spontaneity, dance choreography, and conventional and symptomatic pantomime. All the data compiled and harmonized result in blocking, pantomime, and business principles and practices that are relatively consistent with each other and with the sources studied.

A system is developed by the study that classifies the movement meanings into four basic categories: abstraction, mimesis, metaphor, and symbol. They refer respectively to meaning derived from formal or aesthetic elements in composition, from imitation of natural and cultural body movement, from borrowing movement in the culture analogically, and from conventionalized movement sign language.

The major findings of the study are three-fold. First, many directors, to convey meaning, depend upon the still picture and words to the extent that the existing knowledge

of movement is rarely used to anywhere near its potential; however, a great many of movement's meanings derived from the cultural and theatrical heritage, and illustrated in the study, are already available to the stage director.

Second, few if any investigations made in a theatre during a performance have tested directly what a theatre audience understands stage movement either to mean by itself or to contribute to script meanings; hence, a great deal of what is known and practiced, compiled by this study into norms, can be profitably subjected to controlled testing to discover wherein the meanings lie.

Third, even the movement oriented director seems to be restricted to what is currently practiced or to what is scientifically discoverable about present stage movement meanings, but if he will accept the role of creative artist as described by the study he can to some extent supplement the known and the discoverable by creating new movement meanings; he can, by association and familiarization, both enlarge and enrich the present meanings until they may eventually reach the proportions of a complete language of stage movement.

CONCLUSIONS: TOWARD A LANGUAGE OF MOVEMENT

ix

INTRODUCTION

I. AREA OF INTEREST OF THE STUDY

The central concern of this study is to investigate
the meaning of gross movement on the American stage today.
By gross movement is meant the larger pattern that is
usually referred to as blocking. However, gross movement
cannot be studied with accuracy unless its relationship
with fine movement is also investigated. Gross movement is
intimately related to, and sometimes indistinguishable from,
fine movement, or what is usually referred to as pantomime,
gesture, physical characterization, or business. The
relationship seems to be organic in that blocking may derive
from character movement, and pantomime may be a refined and
detailed treatment of the blocking. Both kinds of movement
may derive directly from the script or derive from the
director's experience and merely be consistent with the
script. Therefore, the study of the ground covering moves
that are gross movement must include some attention to the
moves that are fine.

The meaning of gross movement is also inextricably
related to the meaning of the still picture. Not only do
the compositional principles of a still picture apply to the
composition of the stage picture in motion, but actual still

1

pictures on stage may be an integral part of the gross movement pattern. For this reason composition and picturization, primarily the meaning of still picture composition, need to be included in a study of the meaning of movement.

Gross stage movement also bears definite relationships to, and in many instances borrows directly from, movement in other fields of study. The closest related fields, choreography and motion picture direction, therefore, are to be compared with stage movement. All three arts have a common heritage and indeed use each others' principles, art forms, and personnel in combination regularly. Practitioners in one field often practice in the other two as well. For this reason some comparison of the movement principles of dance, pantomime, and film with those of theatre can be of special value to the theatre director, both to harmonize their concepts with his and to gain value from their special findings derived from the common heritage. Also, because many directors, choreographers, and pantomimists depend so heavily on them, some attention must be paid to the psychologists' contribution to the meaning of gross movement on stage.

A. Area of Interest in Part One of the Study

The first part of the study is devoted to evolving norms of movement meaning directly from the field of theatre, to discover what the present state of opinion and knowledge

among certain acknowledgedand influential theatre authorities
is concerning the meaning of stage movement.

The purpose will be to correlate, to extend, and to
apply the norms in order to derive consistent theories based
on those norms. The primary sources used for the norms will
be, in alphabetical order, the published play production and
direction texts of Curtis Canfield, Alexander Dean, John
Dietrich, John Dolman, Samuel Selden, and Milton Smith.
Secondary sources include nineteen other texts and over twice
that many individual authorities. Their contribution is
largely to provide corroboration for, or minority dissent
from, the primary sources chosen.

The method of the first part is primarily inductive.
Data is collected and correlated by subjects from each of
the pertinent sources. In every case the data are summarized
rather than quoted in order to present the kernel of the
idea on each subject and to present that idea for easy
comparison, in the same order and form as its corollary
idea. Once the data are brought together comparisons are
made, harmonization is attempted, and conclusions are drawn
in an informally deductive method. The attempt is to draw
principles directly from the data or to deduce principles
that are consistent with the data.

The content of the first part of the study is divided
into five chapters. The first chapter discusses how meaning
may communicate, if indeed it can, both apart from and within

the context of a play production; the chapter includes the
setting up of a system of classification to guide the
ordering of the data. The second chapter compiles opinion
concerning the abstract sources of meaning, composition,
and picturization. Elements of composition are covered
under the categories of mass, line, form, balance, emphasis,
and rhythm. The third chapter deals with the principles of
movement in the context of production, including the normal
phases of plotting that movement, while the fourth chapter
covers the actual plotting of that movement in context.
Under the category of movement in context are discussed the
meanings contributed by the director's addition of mimetic,
metaphoric, and symbolic movement (terms with special mean-
ings for this study), as well as the meanings contributed to
movement by the context of the play.

The fifth chapter compares opinions on what the audience
contributes to the meaning of movement. Such problems as
how the audience views, the nature of empathy, audience pre-
disposition, and aesthetic distance are discussed.

Part one is restricted to opinions from theatre
authorities and comments by the author of the study. The
norms of meaning of movement on stage derived thereby are
then available for comparison with the findings from related
fields.

B. Area of Interest in Part Two of the Study

Part two is devoted to comparing the formulated norms
and theories to, and refining them in the light of, opinions

from related sources.

The purpose of the comparison is to enlarge theatre's movement language through borrowing and adapting principles espoused by influential writers in other movement fields. The sources include authorities from the film art, including Sergei Eisenstein, authorities from the dance art, including choreographer Doris Humphries, and authorities from the pantomime field, including Francois Delsarte. A few psychologists who have opinions directly bearing on a language of movement for the stage are also added to the study.

The method of part two, as with part one, is primarily inductive and deductive, but also analogical. The study correlates the norms from the theatre sources with whatever is found pertinent in the related sources, extends the norms imaginatively into further principles, and adapts new principles to theatre use both directly and by the process of analogy. This process grows out of the metaphorical relationship of one kind of movement with another and results, of course, not in proven or even logically certain principles, but in concepts that are analogically suggestive. The concepts still need testing both by controlled experiment and in stage production in order to find out just what is communicated and how.

The content of part two is divided into two chapters, the borrowings from the screen art and the borrowings from sources that use, or study, movement without speech,

including psychology, dance, and pantomime. Chapter one adapts screen techniques of individual camera shots, montages, and the connotations of the screen frame, as well as the contributions of live television, both directly and analogically to the stage. It includes a special challenge to the director to use the analogical method.

Chapter two, movement without speech, adapts certain empathic psychological principles, meanings derived from choreography, and meanings derived from pantomime to the dramatic stage. Especially noted is the strong influence of Delsarte, as an early clinical observer of behavior, on the dance and pantomime fields, and the lack of contemporary clinical study on the language of movement to advance his beginnings.

Part two completes the comparison of sources for the derivation of norms and principles. The section on psychology is admittedly weak for certain specific reasons: first, because the primary purpose of the paper is to explore the performing arts for the discovery of a unified approach to current theatre movement meanings; second, because the primary methods are deductive, inductive, and analogical rather than clinical or statistical. The only purpose for including psychologists in the study is to show from what sources certain theatre practitioners derive their information and concepts. Ultimately the search among psychological and statistical studies in the field is not

very rewarding for this study. To make existing related studies really pertinent to the language of gross movement on stage, they, too, would have to be adapted by analogy.

C. Area of Interest in Part Three of the Study

Part three is concerned with the possibilities and problems in developing a language of movement for the stage. Its purpose is to explore the area of more dynamic meanings for stage movement and to investigate some of the problems of audience reception of those meanings. The sources are the principles and data already employed in parts one and two of the study and the conjectures of the author of the study. The method remains largely deduction and extension by analogy.

Chapter one focuses on more dynamic movement meanings in both the abstract and concrete categories. More exciting movement composition is sought through the principles of flow and phrase and by the use of balance in time as well as in space. More dynamic meaning of movement in the play context is sought through certain special applications of the three kinds of meaning: mimetic, metaphoric, and symbolic. The attempt is made to find human principles, metaphors, and symbols that contain movement, derive from movement, and will produce meaningful movement on stage.

Chapter two focuses on the limitations and assets of certain special problems in communicating to an audience. Aesthetic and psychial distance are compared, communication

is declared to be an essential ingredient of expression,
and the director is challenged to free himself from the role
of interpreter and to take up the role of creator.

D. Expected Values of the Study

The values of this study are hoped to be two fold: to
provide the director with workable stage movement principles
and to suggest directions the creative director may take
toward increasing the communication possibilities of his
stage movement.

It becomes clear in this study that most of the commonly
accepted opinions of the meaning of movement on stage are
based on long theatre practice, on analogy, on quasi-
psychology, and on culturally accepted symbols; there has
been little attempt in theatre to give movement meanings any
objective validity. However, this is not to undervalue the
study. The theories and principles of movement presented in
this study are most of the logical possibilities implied or
suggested by America's heritage and current practice in the
meaning of stage movement. The concepts derive from the
funded knowledge of a representative group of authorities.
The principles therefore should be practical and workable,
because they are based on current practice. However, these
theories make no claim to certainty or even to tested
probability. They may, however, provide principles that
are well worth testing, as well as practicing, inasmuch as

they represent the best the performing arts can produce,
short of that same testing.

It is the surmise of this study that meaning is
communicated by movement in the way in which the funded
experience suggests. It is the primary job of testing to
discover exactly what element in a total context of movement
on stage communicates what feeling or idea to what audience
under what circumstances. At present the kernel of meaning
is probably buried, in many instances, in a husk of un-
necessary convention.

On the other hand, this study means to point out that
meanings change through usage, and directors can be instru-
mental in making these changes, in creating meanings of
movements through the process of association and familiar-
ization, and not merely in discovering what meanings are
already communicated.

The director who accepts the challenge to be a creator
can start by leaning on his heritage in order to obtain more
exact, more complete, and deeper meanings for his current
uses of stage movement. He may be challenged to keep more
careful and complete control over that movement realizing
what powerful potential it has. He may then extend his
language of movement by direct or analogical application of
movement principles. Finally he may also wish to conduct
controlled experiments with the principles derived from
this study, to clear away the debris of non-meaning, and to

discover exactly wherein meaning lies. In accepting this
challenge the creative director may use this study as a
springboard toward restoring to theatre a more significant
use of its unique quality: expressive movement.

PART I

ESTABLISHING A NORM OF MOVEMENT PRINCIPLES

AND MEANINGS

CHAPTER I

HOW MOVEMENT MAY HAVE MEANING

A. Introduction

Opinions about if and how movement can have meaning cover a wide range. From the authors chosen for this study there is general agreement that to some extent movement can communicate meaning, but agreement is not so general concerning how that meaning is communicated. Part of the problem encountered is that the authors consulted do not use the same terminology or methods. It has been necessary, therefore, for this study to create a system of classification to reflect as closely as possible the mutual intent of the authors. The system is entirely original with this study although the category names are in common usage, to some extent, by the authors studied. However, to serve the purposes of classification better, each category name has been given both a more inclusive and a more exclusive meaning than that of any of the chosen authors.

In establishing norms of movement meaning as derived from certain authoritative and widely used texts on directing, it is first necessary to discover to what extent the chosen authors feel movement can have meaning, and then to derive the system of classification into which those meanings can fit.

B. Can Picture and Movement Have Meaning?

1. An Opinion Poll of Representative Authors

All authors agree to two basic assumptions: (1) the
stage picture and movement when carefully designed are
capable of telling the story of the play, and (2) the stage
picture and movement ought so to function. Most authors
expand this assumption to say that unconsciously, to some
extent, all positions and moves have meanings to audiences
and so the director is obligated to try to select the moves
that are appropriate to the script. Some even proclaim
that most of the movement and picture meanings can be known.
However, what these pictures and moves actually mean is
usually only hinted at, in the broadest of terms, by the
authors. The point is that there is much more general
agreement concerning the obligation of the director to give
meaning to his blocking than there is agreement, or even
statement, concerning what the blocking means. To illustrate
the point here are some representative opinions as to
whether or not movement has meaning on stage:

A. K. Boyd feels that every stage movement must create
a positive effect, to help to express the speech, character
or mood of the scene; a move is not made merely to avoid
stagnation; further, a move must have meaning in itself,
not merely result in a desirable grouping.[1] Herschel Bricker

---

[1]Alfred Kenneth Boyd, The Technique of Play Production
(London: G. G. Harrap and Company, Ltd., 1934), pp. 75-81.

suggests that the director must plan all moves and stage pictures in advance to insure that each will have meaning.[2] Gilmor Brown seems to feel that movement has a definite function in attention getting but that the meaning largely resides in the grouping of the actors between movements; however, movements have certain qualities, such as strength, that can support the verbal play.[3]

Canfield feels that the initial placement of characters will give expression to the characters' relationship to each other; the audience will connect the initial placement of characters with the placement of characters at the end of a scene, or movement, and will see a progression or change in relationship as told by the changed picture; the audience should be able to follow the meanings of a play by sight alone; though Canfield is not so sure that stage areas or moves have inherent meanings.[4] However, his faith in the potential meaning of the stage picture is intact, for he feels that the director's craft is mainly to make certain that the juxtaposition of characters reveals what the characters are to each other.[5]

[4] Curtis Canfield, The Craft of Play Directing (New York: Holt, Rinehart, and Winston, n.d.), pp. 130-165.

[5] Ibid., p. 166.

To Dean, picturization is the placing of characters
to suggest the mental and emotional attitudes they have
toward one another. If the placing is done successfully,
the nature of the dramatic situation will be revealed with-
out the necessity of dialogue or movement.[6] His is the
most highly developed (and probably also the least
susceptible of the authors consulted to general agreement)
system for the meaning of blocking.

Dolman states that the purpose of movement should be
associated or at least consistent with the main purpose of
the play. He implies that specific moves can have meanings
independent of the rest of the context. Good movements
simplify and clarify the script, and some moving compositions
may have meaning only when seen in their full sequence;
isolated or static moments in a movement sequence may be
meaningless.[7]

Drummond feels that movement on stage consists of a
series of meaningful tableaux connected by moving transi-
tions.[8] His view, though over simplified when compared
with that of Dean, Smith, Canfield and others, is still

substantially the theory most emphasized by all the authors studied.

Hewitt feels the actor should achieve a continuously changing pattern of movement designed to express the character and thought of the play.[9] Hopkins says that every movement on stage should mean something.[10] Arthur Krows feels that movement should be restricted to what is vitally necessary to change the stage pictures or to carry actors on or off the stage,[11] whereas most of the basic texts suggest that movement can be much more valuable when specially designed to help interpret the words of the play.

Selden feels that one function of movement is to translate into outer form what is usually only felt as an inner response.[12] In general his entire book is an exposition of how he feels blocking movement affects audiences or communicates to them.

C. B. Purdom also feels that movement can and presumably ought to be in keeping with character and can be planned in relation to the situation of the play;[13] while he also feels that grouping and moves should contribute to the

interpretation of the play.[14]

2. Implications of the Poll

We can see from this compilation that there is general
(though not unanimous) agreement among the theorists and
directors of the theatre that both the grouping and the
movement of actors on stage can and should have meaning to
support a script. However, the writers who give specific
principles and examples of what composition or specific
movements actually convey are few. For most of the authors
studied there seems to exist a faith that movement has
meaning; for a few there is an acceptance of meaning from
only subjective proof.

However, there are two basic implications drawn from
the cited opinions: First, that there is, or can be, some
definite, decipherable language of picture and movement that
generally communicates to the average audience; and second,
that movement and picture must be able to have meaning in
themselves, apart from the words of a script.

The second implication needs some clarification. If
stage movement contributes no meaning all its own to a
total context of a play there would be no point in speaking
of choosing movement that is appropriate to the script. If
the context of the play, largely given meaning by the words

(London: J. M. Dent & Sons, Ltd., 1951), p. 80.

[14]Edwin C. White, Problems of Acting and Play Production
(London: Sir Isaac Putnam & Sons, Ltd., 1939), p. 114.

of the play, gives to movement all the meaning it has, then
any movement would be as appropriate in the context as any
other movement. The movement in itself would be neutral
until the context told the audience what the movement
meant. By saying that movement does contribute meaning to
the context of the play the chosen authors imply, then, that
movement does have some independent meaning to contribute.

It is the task of this study, then, first to try to
discover according to the authors chosen the meanings that
still picture and movement have in themselves, both as
abstract compositions and as parts of non-verbal contexts,
and then to determine how they can help to interpret a
script, that is, what additional meaning they can bring to
a verbal and scenic context.

C. Ways Movement and Picture May Communicate Meaning:
Abstract and Concrete. A System of Classification

1. Meaning of Abstract Formal Elements: Composition
and Picturization

Abstract compositional elements, such as mass, line,
form, balance, emphasis, and rhythm, seem to convey mean-
ings to an audience. No doubt these elements originally
acquired meanings by association with, or abstraction from,
other contexts known to the audience; however, the result
seems to be that meanings now seem to inhere in the abstract
elements themselves.

In directing a play the director must select compositional elements to fit his concept of the themes, moods, and situations of the script. In order to choose he must have some concepts of what meanings those compositional elements will contribute to the context of the play. This meaning aspect to composition will be called picturization.

Composition, then, will be considered the subject of the abstract formal elements of design and their formal relationships; whereas picturization will be considered the subject of the meanings communicated to an audience by the abstract formal elements and their relationships.

It can already be seen, from the realization that formal elements probably originally gained meaning from contexts, that some overlapping is bound to occur in the categories of abstract and concrete meanings.

2. Meaning of Concrete Contextual Elements: Mimesis, Metaphor, and Symbol

Movements that require actors in the context of a stage in order to have meaning seem to derive from certain relationships: those between actor and actor, between actor and stage, and between actor and audience. These relationships include posture, direction of facing, and relationship to stage setting as well as to all the abstract elements of composition.

In a sense all of the meanings derived from contexts are symbolic, in that they stand for something other than themselves, something that is usually in real life off the stage. But the way in which these symbolic moves communicate seems to fit into three categories: mimesis, metaphor, and symbol. Although all modes seem to be in some sense symbolic, the term "symbol" will be retained for the third category.

a) <u>Mimesis Defined</u>.--First a picture or move may mean itself. Strictly speaking the picture or move involves an actor who is in a position, or moves in a way, that is supposed to resemble what a real person would do were he in the situation the play represents. This category, called plot movement by Canfield, necessary movement by Smith, and variously, essential, dramatic psychological, and script movement by others, is that which directly expresses what is necessary to the furthering of the plot. For example, walking to open the door and to let in an entering character or sitting down because one is crippled, are classified in this category. Strictly speaking these moves and positions are a language. They do convey meaning of a non-verbal variety. They signify more than themselves. They are symbols in that they stand for real moves that would really be made in similar circumstances in real life. Hence, they are the closest moves possible to the real in art.

Why should this point be made? Because, as most authors agree, no stage move is identical to a real life

move. All are at least somewhat distorted if only to make perfectly clear, across the physical distance to the audience, what the real move would be like. So even the simplest "realistic" movement can be seen to be part of a language where the move stands for something other than itself.

b) <u>Metaphor Defined</u>.--Second, a picture or move may have an analogical relationship to some other movement already known to the audience. The way the stage picture borrows meaning from its analog this study calls metaphor.

The authors studied feel that meaning can be borrowed in a variety of ways to depict both the psychological nature of characters and the thematic nature of the play. For example, all the authors agree that actor positions may indicate affinity for, or opposition between, characters on stage. Such meaning is variously described as social, psychological, or symbolic. The inner or outer emotional state of affinity, or the verbal context of affinity, is depicted by character proximity. Similarly, inner opposition is depicted by wider separation between characters. Carrying this over into movement, physical approach is supposed to signify a mental attitude of approach and a physical withdrawal similarly a mental attitude of retreat.

Selden adds to what this study calls the metaphorical classification two more basic moves: rising and lowering, or moving with and against gravity. By analogy, the moves

can mean triumph or submission, overcoming or being over-
come.[15] Positions in metaphor may depict the state of

being overcome or of having overcome. The category of

this meaning, depicting inner emotional states through outer

movement, is a level of meaning different from mimesis. The

outer form symbolizes the inner attitude; the move or

position stands for the felt relationship. This kind of

meaning is metaphorical because it is dependent upon a

ratio: of doubtful accuracy--A is to B as C is to D. As

the mind is to the felt attitude, the body is to the physical

move. If the mind feels attraction the body moves closer.

Smith adds another variety to what the study calls

metaphor. His terms are symbolic move or symbolic position.[16]

He calls the process translating the psychological-indivi-

dual and the emotional ideas of a scene into physical

situations. Translating the "idea" of the scene into

movement is really the second subdivision of metaphorical

movement. The first subdivision concerns the outer

depiction of inner psychological states; Smith's primarily

concerns the outer depiction of ideas in the play. Often

the two modes overlap. To illustrate, Smith lists oppo-

sition, intervention, siding, enmeshing, and pounding. If

two characters are in psychological opposition to each other

---

[15]Selden, op. cit., p. 276.

[16]Milton Myers Smith, Play Production (New York:
Appleton-Century Company, 1948), p. 101.

they move apart and stand in physical opposition to each other; similarly if two ideas of contrasting themes are in opposition to each other the characters or groups representing the conflicting ideas may move apart and stand opposed. Opposition is closely related to the previously mentioned affinity, or advance and retreat.

A character separating two fighters or lovers verbally may also do it physically, depicting intervention; a character changing his mind may change sides and stand with the character with whom he is now in agreement. These metaphors can be extended to include a pacing move for mental vacillation; a static center position for indecision, and a hiding movement behind the character he sides with if cover is needed.

Enmeshing, or surrounding, would be appropriate for either a group antagonism or a group reverence for an individual. The body postures, the quality of the moves, and the context should clarify the specific purpose of the enmeshing while pounding is a sort of thrust and retreat move, not unlike fencing.

The dangers of such relationships in the language of picture and movement is that an audience may not be able to read back into the move what was its original metaphor. Whenever a metaphor is employed, without a context, an audience member may pick his own metaphor by which to read the move. Obviously then several other factors must be

present in a move to give it more specific meaning. In general, the way in which the move is made, the accompanying business, and ultimately the plot situation may serve to clarify the metaphor.

For now these examples are sufficient to define the category. The analogical relationship is the important element that separates metaphor from other modes of movement meaning.

c) <u>Symbol Defined</u>.--Third, a picture or move may stand directly for another symbol, word, or verbal concept. If a movement has such a specific meaning of a verbal sort the movement would be, in effect, part of a sign language. Hula dancing movement, Noh and Kabuki movement, Balinese movement, deaf and dumb sign language, and certain accepted symbols in some American modern dance are examples from this category. Since there does not appear to be an American theatrical sign language this third category may have to remain largely empty except as the director borrows from the dance or derives or creates new symbols that may only hold meaning for one particular production. The category of the literal symbol is the ultimate in movement meaning and seems to this study to complete possibilities for the meaning of movement in the context of the play.

<u>3. Use of Abstract and Concrete Ways of Communicating</u>
<u>by Picture and Movement</u>

a) <u>Movement to Support</u>.--A director's stage movement

may support, strengthen, enrich, or underline the surface

verbal meanings of the script. The movement may have meaning

through mimesis, metaphor, or symbol, but the meaning of

the movement is either the same as, or positively related

to, the meaning of the words of the script. In such a case

the words and moves combine to provide a single unified

meaning. The movement supports the words.

b) <u>Movement to Contrast</u>.--A stage movement may con-

trast with the surface verbal meanings of the script. Again

the movement may derive its meaning through mimesis, metaphor,

or symbol, but the movement meaning will contradict, or some-

how be negatively related to, the surface meaning of the

words of the script. Such a move can be called contrasting

or contrapuntal. Its purpose can be to editorialize upon

the words, to make a comment, rather than directly to support

them, or it can be actually to deny the meanings of the

words. The contrapuntal move can be used where the inner

state, either psychological or thematic, contrasts with the

outer verbal form. As an example, the words may sound

serene while the character is disturbed. In such a case,

the words may sound like an advance but the move can be a

retreat. The words may say, "I'm on your side," but the

positions can show opposition.

The contrapuntal move can be useful in both comic and

ironic situations, but for such a contrapuntal use of

movement and position to work, it is essential that non-

verbal communication can be in fact possible; that moves can

have meanings apart from a verbal context.

D. Conclusion: Summary of Ways of Meaning

All forms of movement and picture communication discussed by the authors studied seem to be encompassed in the four categories mentioned: abstraction (picturization), mimesis, metaphor, and symbol. Whatever can be communicated apart from words seems to be done by a movement either that partakes of certain abstract, formal design elements, that stands for a movement in real life, that is derived from a metaphor, or that is part of a special sign language. Of course there are all degrees of distortion from nature and elaborate extensions of metaphor to produce both conventionalized and esoteric styles, but the same basic categories of meaning seem to apply throughout.

CHAPTER II

COMPOSITION AND PICTURIZATION: ABSTRACT SOURCES
OF MOVEMENT MEANING

Chapter one has suggested the ways in which movement and picture may communicate meaning. The first of those ways is through the abstract, formal elements of design, in other words through picturization, the meaning aspect to composition.

In general terminology and concepts of composition there seems to be a fairly wide area of agreement among the principal writers in the field of play direction and production. Whereas the actual meaning of some of these compositional elements gives rise to most of the more interesting differences of opinion.

In many instances cited the elements under consideration were considered by the authors studied primarily as attributes of the still picture. It is this study's contention, corroborated in due time, that most of the compositional elements can be attributes of the moving as well as the still picture.

First this chapter will present extended definitions of composition and picturization, and then compile the opinions of the authors concerning analysis and meaning of the compositional elements.

A. Composition and Picturization Defined

1. Composition Defined

According to Alexander Dean composition is a term that should be reserved to refer to the structure or ordering of principles of the stage picture or movement and not to the meaning or communication values.[1] Compositional elements of the still and moving picture then will include mass, line, balance, form, emphasis, and sequence.

Still other elements of composition are the spatial-temporal qualities. They include primarily rhythm, tempo, and sequence, elements that differentiate a time and space art like theatre and a time-art like music from a merely space art such as painting, even though the latter may use time terminology in a nonliteral sense. The techniques of combining these elements into a stage picture, both still and moving, and the elements themselves as the tools of design, comprise the subject of composition.

2. Picturization Defined

Picturization, again Dean's term, refers to the creation of stage pictures and movement for the purpose of communicating meaning. It is the process of using compositional elements for the purposes of meaning rather

---

[1]Dean, op. cit., p. 137.

than merely for some inherently pleasing effect. In picturization the meaning of the compositional elements becomes important along with such elements as strength, weakness, focus, symbol, image, association, and phrasing.

The category of picturization, as well as composition, Dean uses primarily, though not exclusively, to analyze the still picture. For this reason many applications of these principles to movement must be taken from other sources or originated by this study.

B. Composition Elements Analyzed and Defined According to the Authorities Compared

1. Deriving a List of Composition Elements

The first task of the director who is planning to move a play is to discover what tools and techniques of composition he has at his disposal. These fall into categories that are generally agreed upon by most of the represented authors. Dean writes of line, mass, and form,[2] as well as emphasis, stability, sequence and balance.[3] Dietrich writes of unity, variety, coherence, contrast, balance and emphasis.[4] He also includes in the term composition the additional connotation of the meaning of the composition; in effect, he combines Dean's composition and picturization into the one term. The term includes the

---

[2]Ibid., p. 197.   [3]Ibid., p. 137.

[4]John E. Dietrich, Play Direction (New York: Prentice-Hall, 1953), p. 98.

"artistic and meaningful arrangement of characters upon a stage."[5] The conceptual basis for the two authors is, however, very similar. They both agree that the meaning of the composition is primary.[6]

Dietrich also includes in composition, rhythm, grace, harmony, contrast and subordination,[7] while Dolman writes of balance, proportion, harmony, and grace.[8] Smith writes about balance, emphasis, and variety.[9] It can be seen that the same terminology for compositional elements keeps recurring in all the works studied with only minor differences in definition of terms; this study proposes the following list to include all the elements suggested: mass, line, form, balance, emphasis, and rhythm.

The next task is to determine what these elements are, trying to avoid for the present the temptation to discuss what they do, or what they mean. First are the categories of elements (mass and line) and second are the categories of arrangement of those elements (form, balance, emphasis, and rhythm). "Rhythm", except as it is found as "sequence" in the still picture, will be excluded until a special section on moving composition.

[7]*Ibid.*, p. 103.

[8]Dolman, *op. cit.*, p. 69.

[9]Smith, *op. cit.*, p. 98.

2. Mass in Composition

According to Dean, mass is the element of composition that gives the effect of weight.[10] Mass may appear light or heavy, delicate or gross, large or small. Mass also gives the effect of size. Of course on stage, as elsewhere, the size of a mass is a function of contrasting masses. A large mass is such only in relation to a smaller mass. A heavy mass is only such in relation to a light one.

The effect of mass may be attained by several categories of elements. Color, number, grouping, and stability contribute as much to mass as does contrast. Bright colors may activate an area or grouping such that the grouping assumes more importance in a picture and has more weight. Mass with a broad base of support can create the feeling of stability and add a serenity or security to a mass. Large mass may be created by close groupings of actors, small mass by separating out individual actors from the group. And of course scenic elements can create mass, though they are not of central concern to this study. Ultimately, mass is a function of contrast. A weight is the most heavy or light on stage to the extent that it contrasts with another weight on stage that is lighter or heavier.

---

[10]Dean, op. cit., p. 198.

3. Line in Composition

The next compositional element is line. It is defined by Smith as the pattern made by outlines or edges or where colors come together.[11] Dean adds the idea that mass and line together determine form and shape.[12] Where two masses meet, where an enclosed mass borders on a background, where the outer edge of a shape is seen, including the shape of an arrangement of actors or the shape of scenery and furniture, there are formed lines in a composition. These lines have certain categorical characteristics that are useful in stage movement design. A straight and a curved line are the basic types and may appear in many combinations for different compositions. The straight may be horizontal, vertical, or diagonal; it may be almost in isolation or in obvious contrast to another line. If straight lines meet, angles and jagged lines will result; a straight line may be complete and continuous or broken. The curved line generally may be a segment of a circle or a segment of an irregular curve such as an ellipse, hyperbola or parabola.

Smith (and others) point out, that lines may also be formed in time as well as in space by the pattern of movement traced upon the stage by an actor.[13] The action may

---

[11]Smith, op. cit., p. 45.

[12]Dean, op. cit., p. 194.

[13]Smith, op. cit., p. 45.

describe a curved or straight line, a jagged line, or, in
conjunction with scenery or fellow actors, provide a pattern
of intersecting lines. It is important to point out this
means of providing line through movement because it is the
beginning of relating principles of still picture composi-
tion to a less developed area in the basic texts studied,
moving picture composition.

4. Form in Composition

When mass is bounded by line shape the result is form.
Many forms of mass and line, or size and shape, may be
grouped or patterned together on stage. The overall stage
pattern can be called the form of the composition. The
main components of the stage composition are the forms of
the emphatic elements and the relatively unused space.

a) _Types of Forms_.--Dean discusses the overall stage
forms as symmetrical or asymmetrical, deep or shallow, and
compact or diffused.[14]

Symmetrical and asymmetrical form will be discussed
later under types of balance. Suffice it to mention here
that types of balance are attributes of form.

The deep form is one that uses a large portion of the
up-to-down stage space, a shallow form uses relatively
little up-to-down stage space. The compact form refers to
the grouping that allows for relatively slight space
between actors. Dean intimates it usually results in an

---

[14]Dean, _op. cit._, p. 200.

unstable composition because it does not have a broad base
and because it is usually grouped in one segment of the
stage. The diffused form has relatively large spaces
between actors and employs a relatively large portion of
the stage. This study suggests that a stage form may be
classified by selecting a point anywhere along the continuum
suggested by each pair of variables. Such a combination
might yield a form of stage composition that was, for
instance, almost symmetrical, relatively deep, and some-
what diffused.

b) Coherence in Form or Sequence.--Dietrich mentions
coherence as an attribute that forms should have.[15]
Coherence refers largely to the space relationship between
characters on stage, as well as between characters and
scenic elements. Dean suggests that such coherence can be
achieved by a form of spatial (or static) rhythm. This
spatial rhythm he calls sequence.[16] In effect, the spaces
that separate characters or scenic elements follow some
scheme of units. Spaces are all multiples or divisions
of some basic unit, similar to the module used by
architects. This rhythm of spaces helps to provide a coher-
ence or a sense of all belonging together.

Another basic method of producing coherence is
through body position and facing. In brief, the positions

---

[15]Dietrich, op. cit., p. 99.

[16]Dean, op. cit., p. 184.

of actors, and the direction in which they look will, as
in good painting, lead the eye around the composition and
then back to some emphatic point.

5. Balance in Composition

Next are the compositional elements that deal with
the arrangement of form in space and time, starting with
balance. There are two varieties of interest to this
study: actual physical balance and aesthetic, or apparent
balance.

a) _Actual Physical Balance_.--Balance may be variously
defined as a state of equilibrium, inertia at rest, or
equal and opposite forces or masses. It is perhaps as
well expressed analogically by Samuel Selden as any,
though all the texts use the same basic metaphor variously
called the teeter-totter, see-saw, or fulcrum and lever
principle.[17] The basic physics formula is weight times
distance equals weight times distance as explained by
Dietrich.[18] Very simply, the principle in physics is that
the weight on one side of a fulcrum multiplied by the
distance from the fulcrum is equal to the weight on the
other side of the fulcrum multiplied by its distance from
the fulcrum. In practice this means that the farther a
weight is from the fulcrum the lighter it must be to
balance a weight on the other side of the fulcrum.

---

[17]Selden, _op. cit._, p. 153.

[18]Dietrich, _op. cit._, p. 100.

In general there are two balanced design types: symmetrical and asymmetrical; and two kinds of ways of achieving the balance: by actual, physical mass, and by the impression of importance or the impression of mass. The design types are derived by considering the center of the stage to be the fulcrum. If the right side is a mirror image of the left the stage is in perfect symmetrical balance. If one side is obviously not identical with the other but both sides balance, the stage is in asymmetrical balance.

b) <u>Aesthetic, or Apparent, Balance</u>.--Perhaps of more dramatic significance than actual physical balance is the impression of balance. Dean calls this the difference between physical and aesthetic balance. In Dean's terminology, aesthetic balance is achieved by weight derived from emphasis.[19] Dietrich refers to it as the difference between physical and psychological balance. To Dietrich the latter refers to the equilibrium of contending forces.[20]

There may be two different principles involved here. In one, weight is given by arrangement; in the other, weight is given by the context of the play. Since this section deals with compositional elements it is best to put off a discussion of psychological weights until

---

[19]Dean, <u>op</u>. <u>cit</u>., p. 189.

[20]Dietrich, <u>op</u>. <u>cit</u>., p. 102.

picturization. Aesthetic weight, however, can exist in
pure pattern apart from context. A bright color may
"weigh" more than a dark, even though the latter is part
of a larger mass. A color or shape that contrasts sharply
with its background may also "weigh" more than a larger
mass that does not contrast as sharply with its background.
Contrasting shapes, line patterns, "busy" compositions may
all "weigh" more than less internally contrasting masses.
Warm colors may weigh more than cool.

1-Apparent Stability. Stable as opposed to unstable masses
may weigh in different senses. Dean feels a mass that
appears top heavy may appear unstable and hence have a
potential for movement, have a more exciting appearance
than a mass that is bottom heavy, or stable.[21] For this
reason for balance a top heavy mass may "weigh" more than
a bottom heavy mass. However, psychological weight may
well involve different principles though with similar
results. The psychologically stable mass (such as a group
of satisfied, resting characters) appears heavy in the
sense of dull, complacent, or unmoving but probably will
not weigh heavily in the stage balance. It does not have
the weight of potential.

2-Apparent Weight of Moving and Static Masses. Another
aspect of apparent balance concerns the relative weight of

---

[21]Dean, op. cit., p. 177.

moving and static masses or characters. According to
Dietrich, the dynamic or emphatic character may outweigh
the static character.[22] However, it still remains to
decide to what extent the moving character is dynamic and
emphatic. To decide with any accuracy the subject of
emphasis must first be discussed; but suffice it to say at
this point that movement attracts the eye and generally may,
under certain circumstances, create more weight for
aesthetic balance than no movement; however, the moving
character may also be psychologically weaker than the
stable character and possibly "weigh" less, though attract-
ing the eye more.

3-Apparent Balance in Time. When movement is introduced
into the problem of balance the field is open to conjecture.
One fairly consistent principle seems to involve a balance
that is achieved in time rather than in space alone.
Canfield speaks of scenes progressing from one stage area
to another with a special area set aside for a particular
scene.[23] Obviously at any particular moment the stage may
be off balance as only one small section is being used.
However, given the duration of the play, each area is used
and the director may achieve a balance in time. A useful
device to suggest schematically how such a balance is
achieved is imaginatively to place all the scenes on the
stage at the same time and see if the result is an

[22]Boyd, op. cit., p. 102.   [23]Canfield, op. cit., p. 134.

aesthetic, physical, and psychological balance. This way
the imbalance of a moment is resolved in time rather than
in space.

4-Apparent Physical Balance. There are several observa-
tions appropriate to balance of movement in time. One is
a tendency, pointed out by Canfield and Dietrich, of
thinking of a section of the stage as temporarily being
the whole stage.[24] In essence this means that the audience
may not feel a stage is unbalanced if the small portion
being used at the moment is in balance, the portion that
provides the environment for the small scene. Such an
environment may be bounded by the actors, a furniture
arrangement, lighting, or by scenic elements, and the
area may temporarily appear to be a stage within a stage.
In effect, this small scene tends to pull the center, or
fulcrum, of balance over to itself and to eliminate the
rest of the stage as far as having any effective weight
is concerned.

6. Emphasis in Composition

Within the balanced form composed of mass bounded by
line certain elements can achieve relative degrees of
dominance. This attribute, called by various authors
focus, directing of attention, as well as dominance, will
be called in this study emphasis. It is achieved by many

---

[24]Ibid; Dietrich, op. cit., p. 99.

subordinant elements of arrangement grouped for this study as centrality, convergence, stage area, contrast, sequence, space, isolation, stage level, body position, and restoration of balance.

a) <u>Emphasis by Centrality</u>.--The most usual cause of focus is centrality. The center of any composition, be it a triangle, semicircle, or line, has potential for emphasis. Of all these the apex of the triangle is most emphatic because it is also at the center of converging lines.

b) <u>Emphasis by Convergence</u>.--The triangle is the figure used by all the authors studied as the basic form to provide maximum emphasis. The apex of the triangle is emphatic because it is at the crossing, or convergence, of two lines, and because it is usually at the center of the composition. The triangle may be regular in shape or broken up into a series of small groupings, arranged either symmetrically or asymmetrically, and still maintain its emphatic convergence.

c) <u>Emphasis by Stage Area</u>.--In Dietrich's discussion of emphasis he groups the elements under the heading of "control of attention".[25] Prominent in control is the relative dominance of the various stage areas. He ranks them in order of dominance as being down center, up center, down right, down left, up right and up left.[26] Dean

---

[25]Dietrich, <u>op</u>. <u>cit</u>., p. 113.   [26]<u>Ibid</u>., p. 108.

designates the areas the same way[27] though he is more concerned with dramatic qualities the areas express than with their relative dominance. The principle expressed by both authors, and others, is that the closer something is to the audience, and to the center of the stage, the more dominant it is. This principle does not account, however, for the suggestion that right is stronger than left. Both authors relate this to the Western habit of reading from left to right; thus the eye seeks the left (stage right) first, making it a stronger area.

d) <u>Emphasis by Contrast</u>.--Contrast is an element that Dietrich suggests may make for emphasis even when the contrasting element is not in a dominant stage position.[28] Such contrasts may consist in part of multiplicity vs. isolation, bright vs. dark, movement vs. still, tall vs. short, or fast vs. slow. Basically, however, the point is that the single element that is different from the rest is the emphatic element.

e) <u>Emphasis by Sequence</u>.--Identified as the static aspect of rhythm, sequence may take on two basic roles in terms of emphasis: negative and positive. Negative use of it may be had by breaking up a sequence. If a group has regular internal sequential space relations, something out of sequence is emphatically contrasted.

---

[27]Dean, <u>op</u>. <u>cit</u>., p. 212.

[28]Dietrich, <u>op</u>. <u>cit</u>., p. 103.

A positive use of sequence may be had by the use of repetition in the sequence. Repetition sets up a rhythm, and the rhythm sets up an expectancy of continued repetition. The last element in a sequence can be emphatic both because it is expected and because it breaks the sequence. The last person in line entering a room, the downstage left end of a diagonal line, or the third movement in a series of three movements can all be very emphatic.

It may be pointed out that emphasis through repetition in a sequence may require combining with other means of emphasis in order to be the most effective. For example, the elements in a sequence may contrast in size with the last element being the largest. A sequence of elements of the same size could result in monotony rather than emphasis.

f) Emphasis by Space, or Isolation.--Space is an important aspect of sequence, but it is also important in setting objects apart from the rest of the composition, in isolation. If a space is also part of a sequence of regular spaces then rhythm can add to the emphasis by isolation. The rhythm sets up an expectancy; a sudden break in the rhythm, with a large space, sets up a vacuum, or unfulfilled expectancy. A final element appearing after the vacuum, then, has an emphasis derived from both rhythm and isolation.

g) Emphasis by Stage Level.--Stage level refers to height above the horizontal plane of the stage. Subject to the principle of contrast, generally the authors studied are

in agreement that a higher element is dominant and a lower element is subordinate. Colby Lewis shows how Leopold Jessner used this particular form of emphasis so blatantly that critics accused him of underestimating the intelligence of the audience.[29] His use of steps to arrange compositions in ascending order was his chief claim to fame. Be that as it may, level is an effective way to achieve focus, when used in conjunction with depth and contrast.

h) <u>Emphasis by Body Position</u>.--A body position can achieve strength or effectiveness to the degree that it is facing the audience. Of course, its degree of emphasis will depend upon its contrast with other elements in the composition, including the direction other actors are facing.

i) <u>Emphasis by Restoration of Balance</u>.--In movement, restoration of balance is a device which can stand more investigation as an emphatic tool. Several authors, including Canfield, mention a stage scene which was planned to be obviously unbalanced. The area which needed "weight" to complete the balance was an area of vacuum. The audience felt something belonged there. When the director placed something there it was for the moment very emphatic. As Canfield points out, however, unless the audience is drawn to notice the vacuum no expectancy is built and hence the emphasis value is not so great. This principle has far

---

[29]Colby Lewis, "Leopold Jessner's Theories of Dramatic Production," <u>Q.J.S.</u>, Vol. 22 (April, 1936), p. 203.

reaching implications for the whole theory of the meaning of movement on stage. It suggests that balance may not be as important to the stage picture as imbalance; that imbalance seeks balance and hence imbalance is more potential and exciting; hence more emphatic, than balance.

j) Emphasis Contrasted with Strength and Dominance.-- At this point it may be well to seek a differentiation in terms. Strength, dominance, and emphasis may all be somewhat different qualities in the achievement of attention. A figure in isolation may have attention but be weak as a character because of context, body facing, or weak stage area. To be more explicit, there are many kinds of weaknesses and strengths that relate to, but extend beyond, composition and will be discussed under picturization.

7. Summary: Composition Elements Used in Combination

All the compositional elements, when used together, can provide an interesting and aesthetically pleasing stage picture. The design will have the rhythm, sequence, stability, and balance of masses and line, with an emphatic center of interest required for any, even the most abstract, of art. However, for theatre, the authors agree, composition is only a minimum. The picture, still or moving, must help to tell the story of the play. These compositional elements must have meaning that relates to the meaning of the script.

C. Picturization: The Meaning of Composition

1. Introduction: Ways Abstract Elements May Contribute Meaning

Abstract formal elements may communicate meaning through still pictures or through movements. Hence picturization will be considered to have two divisions: at rest and in motion, though Dean tends to retain the term for the still picture.

a) Still and Moving Picture Contrasted.--Alexander Dean states that movement comprises the moments of picturization in their ever changing aspects, that picturization derives its principles from painting as movement does from dance.[30]

However, there are aspects to the meaning of still pictures that do not have parallels in moving pictures, even as there are meanings of moving pictures whose unique characteristics do not find a parallel in the static.

In fact an opinion somewhat opposed to Dean's ought to be kept in mind throughout this section. Dolman states that the time dimension in the theatre art must be taken into account in composing the stage picture, because often, parts of a moving composition in isolation are dead and meaningless although significant in sequence.[31] Of course

---

[30]Dean, op. cit., p. 223.

[31]Dolman, op. cit., p. 116.

Dolman does not deny the value of a significant still picture on stage. He merely points out that moving compositions are not simply series of meaningful still pictures.

Dietrich states that the only real difference between the technique of the painter and that of the play director is a difference in depth.[32] This view is based on a prior statement by him that the primary purpose of movement is to dissolve one picture in order to form another, hence the basic art of the director is the art of the still picture.[33] Yet later he suggests that the sole purpose of movement is the projection of meaning, either intellectual or emotional; and again, that without motivation no movement can be meaningful.[34] Although Dietrich does not discuss meanings of abstract elements, the implication is that the still picture may communicate meanings through abstract compositional elements in context, but that movement primarily requires motivation for meaning, hence communicates primarily through psychological mimesis.

It seems that picturization at rest and in motion can both communicate, but how much of that communication is contributed by abstract elements is still in question.

b) _How Much Meaning Abstract Elements Can Contribute_.-- Opinions about how much meaning can be contributed by

---

[32]Dietrich, _op. cit._, p. 98.   [33]_Ibid._, p. 91.

[34]_Ibid._, p. 120.

abstract elements varies a good deal. They range from
Dietrich's, who, as has been seen, feels that very little
meaning is conveyed apart from context, through Selden's
view, that rules of design are more apt to be a hindrance
than a help because of the variables,[35] to Dean's, who
assigns a "family" of meanings to each abstract line
element.[36] Selden does not, however, explain what either
the rules or the variables are; however, from his context
this study deduces that his "rules" would be those that
assigned definite meanings to abstract compositional
elements and his "variables" would be the many colorings
that context would give to the meanings. Dean recognizes
the importance of these "variables", as will be seen, and
so gives a wide variety of possibilities of meanings of
abstract forms to suggest that they may contribute variously
according to context.

Canfield also tends to be careful in his assignment
of meaning to abstracts, such as line and stage area. He
feels that Dean assigned specific meanings that were
really only subjective and hence couldn't be argued.[37]
However, Canfield makes no attempt either to refute Dean
or to establish that Dean's meanings are subjective. It
seems that the director needs more than either a simple

---

[35]Selden, op. cit., p. 65.

[36]Dean, op. cit., p. 197.

[37]Canfield, op. cit., p. 135.

affirmation or denial, but Canfield's readers generally
have to go to other authors for the meaning of design; his
concern, as is Dietrich's, is with the organic relationship
of movement and picture to the script in the context of the
play.

c) Abstract Meanings Separated from Contextual Mean-
ings.--The problem becomes one of separating the meanings
of the compositional elements from their play context and
from other contextual ways of communicating to investigate
the meaning of the abstraction by itself.

This study has already suggested that for a movement
to have meaning in a context the movement must have a
contributory meaning all its own. Otherwise any movement
can mean anything a given context means, and there is no
valid reason for choosing one kind of movement over another.
Of course this study recognizes the vital role of context
to give a total meaning to a picture or movement, but the
study contends that general meanings are contributed to
contexts by design elements and that the context makes
those meanings specific.

d) Sources of Abstract Meanings.--The problem of sepa-
rating abstract meanings from contextual ones is not easy,
for it seems apparent that meanings of abstract elements
must derive from association with prior contexts. In other
words, whatever meaning abstract elements have seems to have
originated from mimetic, metaphoric, and symbolic associ-
ations. For example, Dean refers to the meanings of

abstracts as the effects of composition upon emotion, but the kinds of meaning they have, as will be seen, are largely associational.

However, the difference between the source and the abstract is important. Though deriving from mimesis, metaphor, and symbol the meanings of the abstracts now seem to inhere at least to some extent in the abstracts themselves without apparent awareness by the audience of the original source.

It should be noted, though, that the communication process is analogical. Even the pure empathic communication of abstract elements, the direct motor effect on the audience member, is in a way analogical. The appearance of imbalance, for instance, may create a motor reaction in the audience, but the process is still symbolic. It must start with the visual; imbalance must be seen and recognized. As Dolman points out, a physical imbalance may actually be felt, but an apparent imbalance has to be learned; it is a symbol of physical imbalance.[38] Only after learning the symbol does the audience have a motor response, but a response often without conscious thought. The abstraction has acquired a meaning that is now all its own.

Whatever the source of its meaning, and however inexact that meaning may be, the compositional element seems to be the most basic unit of picture and movement. Meaning

---

[38]Dolman, op. cit., p. 11.

seems to inhere in the compositional element, and the director seems to be able to discover that meaning and to use it to contribute to the context of his play.

2. Picturization at Rest and Its Suggested Meanings, According to the Authors Selected

The elements under consideration are the same ones, and presented in the same order, as in the previous section on composition. They are mass, line, form, balance, and emphasis with rhythm still considered in its "at rest" aspect of "sequence". Although each picturization element is considered in its "at rest" aspects, most of those aspects apply to picturization in motion as well, and will only be discussed in this section. In most instances the overlap is assumed rather than stated. In the section on balance "at rest" and "in motion" aspects will be considered together because of the integral nature of the material.

a) Mass at Rest.--Not many authors suggest meanings for mass, probably because most of the meaning that mass has is derived from how other compositional elements are combined with it. The shape, outline, color, form or contrast of mass really give mass most of its significance. In effect it is the raw material of composition. If it has any meaning at all it is probably in terms of degrees of felt weight. Dean considers mass to be the effect of weight.[39] On stage mass may only be so many square inches

---

[39]Dean, op. cit., p. 198.

of differentiated space, but the space connotes the presence
of an object of a certain size, and that object and its size
connote a certain weight, in part dependent upon the size of
the mass. Obviously how much weight is connoted is a
function of many other compositional elements, but without
the contribution of mass to a composition there would be no
impression of measurable weighted space for the other
elements to modify.

b) <u>Line at Rest</u>.--Dean, Smith, and Dolman make the
major contributions to the meaning of line with Dean
presenting the most complete analysis. For this reason his
ideas will form the basis for this analysis with other
opinions presented only as they dissent from or add to
Dean's.

According to Dean the horizontal line is restful,
oppressive, calm, distant, and languid; the perpendicular
line is high, grand, dignified, regal, forceful, impressive,
frigid, spiritual, ethereal, soaring, and aspiring; the
disgonal is moving, unreal, vital, artificial, arresting,
bizarre, and quaint; the broken horizontal line is casual
while the broken vertical line is violent; the straight
line is strong, stern, formal, severe, simple, close (near),
and regular, while the curved line is natural, intimate,
quiescent, free, graceful, flexible, and cozy.[40] Each of
these line types can be combined to produce composite

---

[40]<u>Ibid</u>., p. 197.

qualities. Or several lines may be used in combination, such as a curved horizontal line with a straight vertical; some contrasting combination of the qualities also results.

Smith takes line meanings one step further by identifying different kinds of curves and intersections of lines. He agrees substantially with Dean when he writes that a long straight line is serious, a vertical line is noble and dignified, and a horizontal line is earthy and stable. He adds that long slow curves are sensual and fanciful while sharp curves, arcs, and segments of a circle are mostly comic; jagged lines and sharp angles are exciting and dramatic.[41]

Dolman suggests, in agreement with Dean, that the curved line is effective for grace. He adds to Dean's idea that straight lines are formal by suggesting that both straight lines and segments of a circle are too forced and unnatural, requiring artificial tensions to maintain them, while slow curves are more natural, graceful and empathically satisfying.[42] Substantially, the rest of the basic directing and producing texts agree with the above general format or are silent on the subject. The dissenting opinions, not stated here, do not contribute more to the meaning of the line but largely voice cautions not to put too much faith in claims for exact meanings, and give warnings that there is

---

[41]Smith, op. cit., p. 46.

[42]Dolman, op. cit., p. 71.

little experimental proof of the contentions.

The line meanings of Dean need a sympathetic and imaginative interpretation to be of any positive value to the director. There are seeming contradictions in the list; there are qualities that do not seem to fit together; the list appears too set and dogmatic, even as Selden or Canfield might point out. The key to the variety of meanings may be that Dean realized that the abstract lines needed to be related to specific contexts in order to carry one of his specific meanings. At least such an interpretation brings order to the list. A line employed in a stage setting usually becomes the outline of a specific object. If the line is a horizontal one, for example, it may partake of one of the qualities Dean lists largely because of the context. For example, it is an horizon and so distance is suggested possibly along with calm, earthliness, and repose. From this simple example, it can be seen that many seemingly very different "meanings" of the lines and patterns, as expressed by Dean, are really dependent upon their context. His is in effect a sampling of the range of meanings a line can have in context.

Dietrich's thesis is herein justified, it seems. To have as specific meanings as Dean suggests may well require a context beyond the abstract line pattern, otherwise each viewer chooses his own association.

On the other hand, Smith and Dolman try to suggest a

general meaning for line that is less dependent upon context.

Even here, however, a great deal of unconscious association

is employed. For example, the horizontal may be calm be-

cause it is associated with the horizon. The straight line

may suggest severity as it is associated with the straight-

laced personality. The curved line may seem cozy as it is

associated with a friendly enclosure, or it may produce panic

if associated with a trap. Hence, by conjuring up an image

of what the line reminds us of, or by feeling about the

abstract line the same as we feel about the object from

which it was abstracted, the audience may feel emotion from

a line. The original source for the line may lend its

connotation to the stage picture or stage move. The curved

line may connote "enclosure." When given the specific con-

text of the scene, the line then becomes more specific in

its connotation, because certain possibilities are eliminated.

The image, from which the audience abstracts, more closely

parallels the situation of the play. The context then gives

the audience the clue as to which of the meanings of Dean is

closest. The "enclosure" becomes either "cozy" or "trap."

Yet, it can be seen that Dean, Smith, and Dolman all

suggest that a certain family of traits is inherent in line

formation. If they are right, in at least some general way

there are line patterns appropriate and inappropriate to

certain contexts. As Smight might put it, the straight line

seems more serious, the long slow curve more graceful and

sensual, and the tight curve more comic; the jagged line is

more exciting.[43]

The writer of this paper has tested abstract line patterns with many groups of students and community groups to try to find out if there is any objective truth to the ideas above. Always the family of traits suggested by these authors is expressed by the audience, without a context necessary. The tests were no doubt without proper controls and subject to a variety of interpretations, but the results were too consistent to discard the theories as mere subjective judgment on the part of a few directors.

One reason for the consistency has already been suggested: consistent association with objects of that particular line pattern. There seem to be two general kinds of association that would account for the connotative meaning of any symbols; they are: cultural association, and psychological nature. In fact both are probably inextricably related. A certain line pattern may have come to have a certain meaning culturally because of a relatively consistent use in association with certain basic moods. A curved line may be learned as comic because many cartoonists employ it in comic drawings. On the other hand, the drawings may be more comic because they employ sharp curves. It seems difficult to say which came first without fairly extensive inter-cultural tests. To establish any real, basic universal

---

[43]Smith, op. cit., p. 46.

meaning for abstract lines it seems some correlation would
have to exist between the nature of our senses and the nature
of the line.

Here, then, are some proposals that may start con-
jecture about a third reason for consistent meaning of line.
Lines may have meaning partially because of the nature of
sight and also partially because of human motor responses.
When the eye follows a curved line, there is no felt
interruption to the flow. The smooth continuity may affect
motor responses, may set up an expectancy that is satisfied;
it is restful because it is anticipated. A broken line of
irregular variety may destroy what the eye expects, or not
even allow an expectancy to occur. The result is apt to be
a restless feeling. A sharp angle may unexpectedly interrupt
a flow, or reverse an eye movement. The unexpected may be
exciting. The above conjectures about association by
metaphor, association by social conditioning, and emotional
response by motor response to eye movement, may in large
part provide a basis for the meaning of abstract line.

To examine further the validity of abstract line's
meaning will require the assistance of related fields, or of
special tests. Conjectures here have already gone beyond
the purpose of this section, what the selected theatre
authorities have to say. At this point it seems that the
normal expectancy of theatre people is that certain line
shapes and patterns can produce certain emotional responses

in an audience and that, when combined with concrete
picturization and movement, they tend to imbue these concrete
elements with their metaphorical, connotational, habituated,
and innate meanings.

The kind of treatment that each author accords to the
meaning of other formal entities is similar. Therefore there
is no need to repeat the analysis of the different kinds of
meanings involved or the general approach to the relative
subjectivity of assigning values. Suffice it to present the
views.

c) <u>Form at Rest</u>.--The authors studied classify emphasis
and balance to some extent as attributes of certain types of
form. For this reason there is some overlapping in cate-
gories though balance and emphasis will each be covered in
separate sections.

1-Emphasis vs. Meaning in Form. Forms of stage compositions,
particularly the balances and shapes of masses, may be said
to have two general reasons for use. The first is to create
emphasis, the second is to contribute meanings. Every basic
text is more or less explicit on the ways in which forms may
direct attention for emphasis. Possibly Dietrich is the most
complete though Canfield, Dean, Smith, Dolman, and Selden all
have largely mutually consistent views. They concern what
Dean might call compositional elements: how to gain emphasis.
To create meaning through form the director needs to know
more: what the different meanings of the different forms are,

why the director uses one kind of emphasis rather than
another, and what one variety of focus says better than
another.

The first use of a formal arrangement on stage is to
gain focus or emphasis, and one task of this study is to
investigate what a particular variety of emphasis contri-
butes (usually connotationally and emotionally) to the stage
picture. The second use, to contribute meaning, refers to
the meaning, if any, of the abstract form itself: feelings
that are conveyed by particular arrangements of mass and
shape and balance. The latter shall be taken first as it is
the most abstract and basic; i.e., the least dependent on
context for its meaning. The first has its basic meaning in
pointing to an object or line or actor that is expected to
carry the primary meaning; though the type of emphasis used
may also suggest an underlying point of view about the content
of the primary meaning.

2-Meaning Contributed by Form. Most of the authors and
directors give assent to the principle that the gross group-
ing on stage can contribute meaning to the play, as Tyrone
Guthrie puts it, over and above the common sense positions of
people in a situation; ideas and emotions underlying the
scene can also be expressed.[44] It is Dean again, though,

---

[44]Toby Cole and Helen K. Chmoy, _Directors on Directing_
(rev. ed.; Indianapolis: Bobbs-Merrill, 1963), p. 251.

who attempts the most complete statement of what these

abstract elements of arrangement mean.

To recapitulate, Dean considers mass to be the effect

of weight.[45] In other words, for the stage, actual weight

is of little importance. To extend the views of our main

texts, psychological balance, aesthetic balance, or physical

balance are really all achieved through objects, shapes, or

groupings appearing to have relative sizes and/or importance.

The actual physical weight of the mass has no effect on

dramatic balance.

3-Types of Form. The next point is to see what arrangements

of these masses do to an audience. This arrangement is

usually called form.[46] Dean, it has been noted, lists six

varieties of form: symmetrical, irregular, shallow, deep,

compact, and diffused.

The symmetrical form, an arrangement of regular or

repeated forms with the mirror image relationship between

stage right and stage left, Dean feels conveys a sense of

formality, artificiality, coldness, hardness and quaintness.[47]

The first reaction to this list of attributes is apt to be,

that "quaintness" doesn't seem to be of the same genre.

Again, as with line meanings, it seems that the only

sympathetic interpretation of this listing is to suggest

---

[45]Dean, op. cit., p. 198.

[46]Ibid., p. 200.   [47]Ibid.

that Dean needs a context to give his specific meanings to
form.

One way of achieving a comic effect is through ex-
cessive regularity, a mechanical pattern, imposed upon
fluid life. Hence, given a situation in a play that does
not seem to merit such a symmetrical treatment, a director
can gain a comic perspective by making his stage picture
provide a symmetrical comment on the situation. This would
be an example of the contrapuntal use of picturization.
The other attributes of the symmetrical form appear to be
those wherein the arrangement is used to support a context.

The irregular form Dean lists next. Other authors
usually call this asymmetrical. To Dean this provides a
casual, impersonal, realistic, informal, free, or sincere
impression. Here the list appears to have validity with
the possible exception of "impersonal." This seems to fit
equally well into the former grouping of symmetrical relation-
ships; the type of situation Dean had in mind again might
have explained its inclusion. The rest of the attributes,
in comparison with "symmetry," give us a clue to his method
of arriving at the list. In a sense it is by an adoption
of Aristotle's "imitation of nature"; that is, his is an
imitation of culture. Usually, as is obvious, formal, pre-
planned situations in cultural life, ceremonies and the like,
carry with them a patterned arrangement, a regular and
balanced appearance. By association, the audience expects a

regular or formal proceeding when presented with the arrangement on a stage. In unplanned, informal, or "realistic" situations there is usually an unplanned, irregular appearance. Hence, by association, a relaxed and informal atmosphere on stage may result from a use of the "real life" arrangement. Of course, "appearance" of unplanned is an important word. Neither Dean, nor any of the other authors, askes for really unplanned pictures.

The deep form and the shallow form yield less agreement among the several authors; Dean feels that a deep (multi-plane) form, one which makes a considerable use of up and downstage space, conveys warmth, richness, mellowness, sincerity and realism. A shallow composition conveys quaint-ness, artificiality, shallowness, alertness, efficiency, and immediacy. His reasons are not clear but an analysis of the attributes seem to suggest a verbal analogy. In effect, a deep composition physically shows a deep feeling emotionally, or a deep thought intellectually. Action taking place on many physical planes suggests ideas and feelings on many emotional and intellectual planes. The contrary, of course, would be expected of the shallow-scene. However, the shallow seems to have other attributes that suggest immediacy. Here it seems that context is partly the ruler again. Shallow downstage might mean immediacy, shallow upstage might merely mean artificial. Shallow combined with compact might suggest "immediate togetherness." Shallow and regular might suggest

quaintness, if the context is comic. Again the importance
here is to see the family of meanings that Dean feels inhere
in certain forms, meanings that certainly require the use of
life copying, metaphor, and association to have a residual
meaning, and certainly need a context to have a specific
meaning; still the groupings do make a special contribution
to, and a comment on, the scene, it would seem; not just any
pretty picture would accomplish the desired support comment.
But it is difficult to see how the depth of composition could
have any of Dean's specific meanings without the appropriate
context.

Three other authors have significant contributions to
make on the subject of depth: Dietrich, Jessner, and Dolman.
Jessner's view is not unsimilar to many constructivists and
proponents of symbolic staging such as Appia, Meyerhold, and
Tairov; it is just that Jessner seems to be clearest on this
point of depth.

Dietrich at one point mentions that the only real
difference between the technique of the painter and that of
the play director is a difference in depth.[48] In another
place he points out the usual designation of strong and weak
areas, previously cited, suggesting that upstage positions
are generally weaker than down.[49] But later he suggests
that movements toward and away from the footlights do not

---

[48]Dietrich, op. cit., p. 98.

[49]Ibid., p. 108.

affect balance.[50] His latter statement would suggest a definite limitation in the possibilities of meaning differential between up and down stage, a differential he has previously maintained. The problem bears exploration. It can be seen how a member of the audience, sharing eye level with an actor, will notice less apparent movement toward him than from side to side; it can be seen how the right-to-left stage balance will not be affected thereby; but to suggest that the total stage balance would not be affected would seem to nullify the differences in the relative strengths of up and down stage areas, and to suggest that for purposes of strength a play need take place only in the plane of the proscenium.

One solution to this problem might be to mention that strength and balance are not identical, though related, on stage. A face coming toward the audience may appear to be getting stronger without appearing to tilt the boards. Still, if there is any audience impression of up-and-down by areas, by furniture placement, by groupings, or by scenic elements, then it would seem that balance involves the horizontal plane of the stage floor and not just the vertical plane of the proscenium. This latter view seems closer to Dolman's when he suggests that the stage exists in four dimensions, unlike the painter's two.[51] It certainly

---

[50]Ibid., p. 140.

[51]Dolman, op. cit., p. 116.

complies with Dean's view of depth and also with Dietrich's adding of depth to the tools of the stage "painter."

Perhaps Jessner gives us a clue to the solution with his famous steps. As Jessner points out, his steps allow for a better three dimensional composition, both real and apparent. By raising the back of the stage, upstage becomes observably different in depth.[52] Of course, a tilted stage gave the name up and down stage to the areas to begin with; Jessner's method merely allows him to break the tilt into a series of planes for level acting areas. Appia did something similar with his space staging; however, it would seem that the theatre's tilted auditorium floor and balcony might also tend to make contemporary stages more three dimensional in appearance and make for a more three dimensional balance. At any rate, physical depth, or the appearance of physical depth through actors placement on identifiable stage planes, ought both to include depth in the problem of balance and perhaps also to help depth contribute analogical meaning to a scene.

The compact form, to Dean, conveys warmth, force, horror and power. Here, more than ever, it is necessary to refer to context and culture for understanding Dean's specific meanings; however, by now that method should be clear and will not be further labored. Suffice it to say here that

---

[52]Cole, op. cit., p. 326.

there are more meanings possible than given. The warmth of togetherness, the force of united strength can be seen, but the huddling together because a group is cold or afraid may also be a possible metaphor for the compact composition. Therefore, there are two distinctly different and anti-thetical possibilities in compact groupings depending upon whether they are motivated by weakness or aggressiveness. Perhaps of equal importance is the principle of old time actors voiced by Selden,[53] that space gives individuality; a compact grouping may say "mass" as opposed to "individual." That is, it may convey a feeling of impersonality. It may also convey a feeling of instability if it is huddled in one section of the stage with relatively empty space else-where.

The diffused form, to Dean, conveys indifference, cold-ness, turmoil, defiance, and individualism. The connotations should be obvious from the previous discussion of compact. Again by analogy and nature, the audience may feel the characters are unrelated to each other emotionally to the extent that they are also unrelated physically on stage. Again the context may become vital to make sure that the audience is using the same metaphor as the director. Still the family of meanings is fairly clear: separateness may be conveyed even though the specific quality of separateness

---

[53]Canfield, op. cit., p. 251.

only appears in a specific context. Or as Dean puts it, the
director first conveys feeling (in his order of planning the
stage picture) in the general manner of his composition, and
then clarifies it later with the arrangement of details.[54]
4-Sources of Formal Meanings. A few principles of the sources
and varieties of meaning of groupings assert themselves. It
would seem that there are two general types. If the arrange-
ment actually resembles what the audience would expect to
see if the stage event were to occur in real life, there is
the illusion of life. The arrangement is a symbol for the
real. On the other hand, the arrangement could also be a
metaphor. Perhaps there is no formal necessity to the scene,
no real-life counterpart, but the director abstracts from
an analogous situation the formal grouping he finds there
and applies them to the scene, because the director may wish
to make a comment through his borrowed form. His abstract
grouping principle, then, is derived from either mimesis or
metaphor, though the form has now taken on a meaning
presumably apart from the recognition of source.

In any event, the director first conveys some general
feeling through his formal scheme and then clarifies the
feeling with added details.

d) _Balance at Rest and in Motion_.--Because many of the
problems about balance derive from relationships between the

---

[54]Boyd, _op. cit._, p. 201.

two types, balance at rest and in motion will be discussed
together in this section.

Balance is a compositional element generally agreed
upon as essential to the good stage picture. There is the
core of opinion grouped around the need for balance, a need
based on its pleasant, satisfying, and stable character-
istics. There is also a suggestion, only slightly developed,
that there are definite needs for an unbalanced stage
picture. The latter suggestion provides the basis for a
conjecture that imbalance may be an essential ingredient
to the stage picture in motion.

1-Balance vs. Imbalance. Dietrich speaks of a serial or a
circular response pattern in dialogue, and also of a
motivated situation continuing until a state of balance is
regained.[55] For now it will be sufficient to explain that
the pattern refers to a contextual imbalance, such as one
of conflicting motives with one movement taking supremacy
over the other in alternation until a state of equilibrium
is gained. In this pattern imbalance in motivation and in
the forces within the situation, at least at any particular
moment, are essential for psychical movement. In effect,
imbalance seeking balance results in movement toward a
conclusion. As Dietrich puts it, a psychological balance is
achieved when an equilibrium of contending forces is

---

[55]Dietrich, op. cit., p. 16.

achieved.[56] Earlier, he states that anything not in equi-
librium is displeasing.[57]

The two ideas suggest at first a surface contradiction.
It seems that the majority of a scene has to be in a state
of imbalance in order to keep it from ending. When the
scene becomes balanced it also is over. If the observation
is accurate, then only the conclusions of scenes are pleasing
and the main body of the scene is displeasing. To correct
this conclusion, it would seem that perhaps some analysis is
appropriate here. What do some of the other writers main-
tain?

Dean also writes that viewing an unbalanced scene is
distinctly unpleasant.[58] While Selden, substantially agreeing,
finds that an unbalanced scene sets up an expectancy for a
balance and that expectancy satisfied is very satisfying.[59]
Selden's observation is not basically at variance with either
Dietrich's or Dean's; however, all suggest that imbalance is
displeasing and balance is pleasing.

Perhaps a helpful idea would be to contrast the im-
balance of the still picture with the imbalance of the
moving picture. It seems that a still picture that is
unbalanced is unpleasant because there seems to be within it

---

[56]Ibid., p. 102.   [57]Ibid., p. 100.

[58]Dean, op. cit., p. 183.

[59]Selden, op. cit., p. 172.

no potential for change to a state of balance. Being static
it appears to be set in a permanent state of imbalance.
Whereas a scene in motion, but unbalanced in appearance or
feeling, is not in static imbalance but may be in potential
balance, moving toward balance. Hence, when translated into
movement terms, the unpleasant may only appear disquieting,
or, more positively, exciting; more so if the picture seems
to be moving through obstacles, through states of relative
balance to imbalance, with the real possibility, seen by
the audience, of an eventual state of balance.

Selden goes further than the other authors to suggest
that imbalance is the essential element, not balance, to
the ingredient of motion in theatre. He explains that when
an organism is in balance (or equilibrium) with its environ-
ment, it seeks no transit or change. Further that every
object or organism that appears to be out of equilibrium
with its environment, and is trying to re-establish that
equilibrium, has within it potentialities for movement; that
movement itself is the process of adjustment.[60]   Such a
view, again supports Dietrich's psychical view of the
function of imbalance. However, what appears strange is,
how, with these views, either author can consider imbalance
"unpleasant"; it would seem rather to be exciting, potential,
and vital as opposed to static, and monotonous. The only

---

[60]Ibid., p. 148.

reconciliation appears to be as previously stated, that imbalance not in the process of readjustment can be irritating in that it is failing to fulfill expectancy.

At any rate, the conclusions of the authors are these, that balance is pleasing and imbalance is not, especially within the frame of a still picture; that such balance is an apparent not a real one (that is, a psychical and/or aesthetic balance, not a physical one); and that there are exciting implications for the role of imbalance in what Selden calls the pursuit of adjustment.[61]

2-Meanings of Balance or Imbalance. With the above said, are there, however, any particular "meanings" to balance or imbalance? Perhaps there are at least conveyed feelings: imbalance can create in the audience, hence mean, excitement, unpleasantness, expectancy, or some form of disquiet, depending upon whether it is imbalance at rest or imbalance in motion. At rest, imbalance can perhaps also imply motion, hence imbalance can mean that motion can soon be expected. Balance can perhaps convey, hence mean, peace, quiet, rest, satisfaction, correctness, or boredom, again depending upon how long it is apparent what precedes it (i.e., whether it is a resolution of imbalance or merely a static state), and what follows.

The varieties of balance, symmetrical and asymmetrical, have already been discussed under the category of "form" so

---

[61] Ibid., p. 137.

the above may exhaust the general possibilities for the meaning of balance and imbalance as an abstract formal element.

3-How Balance Meanings are Derived. It remains to suggest in what ways the meanings of balance are derived. As an example, Dietrich's serial response pattern seems to have roots in the illusion of life, mimetic category, while balance achieved in time, first one force superior and then another, suggests a physics principle such as illustrated by the pendulum, hence derived from a metaphor.

The point here is merely to suggest that a mimetic or a metaphorical basis, derived from everyone's experience is the source for the feelings expressed by balance on stage. As Dolman points out, without previous experience of such states as imbalance, and, very important, without the visual recognition of the symbol for that imbalance, an audience's motor responses would not take place either pleasantly or unpleasantly in reaction to the effect.[62]

e) Emphasis at Rest.--Translating emphasis into meaning eventually will have to take on a less abstract look; for emphasis deals not only with abstract arrangement of parts but also with posture and direction of facing of human bodies. In this section, however, the abstract character will be explored to see if there are meanings to kinds of emphasis

---

[62]Dolman, op. cit., p. 11.

beyond the mere strength and weakness of emphatic and non emphatic character, meanings that are separate from the contextual meaning that results from implied human relationships. For again, in composing a scene if the human relationships alone give the emphasis a meaning then there would be little reason for selecting one kind of, e.g., strong, emphasis over another. The authors studied give such specific meaning of emphasis only to stage areas.

1-Stage Areas: Strength vs. Meaning. All authors generally agree as indicated in the section on composition, about the order of strength of the various stage areas. They do not agree so well about the emotional qualities of scenes played in those areas. To compare views, there first needs to be a distinction drawn more carefully between "strength" and "meaning." Strength is akin to emphasis in that it is a compositional element more than an element of picturization. A person, or idea, or scene emanating from a strong area, or moving into a strong area, places emphasis upon itself. The meaning, though, is dependent on the context of the scene, the idea expressed, the appearance of the person. To under-score through strength, or to minimize through weakness is, no doubt, to contribute something to meaning; the position contributes importance. But "strong" and "weak" do not stand for something other than themselves. They are strong and weak areas of the stage; they are not standing for strong or weak areas in nature. Nature does not have a proscenium,

and hence strong and weak areas are not found in areas in nature; they correspond to aesthetic factors derived from art or from ceremony. The areas have inherent strengths only because they maintain a constant and consistent physical relationship to the entire audience. Such strength designations change quite radically in arena theatre where the conventional proscenium stage areas no longer apply. 2-Stage Areas: Meanings. However, allied to this strength and weakness are certain inherent or acquired meanings to stage areas. On this point there is perhaps the most disagreement of all with neither Dean's nor his opponents' points of view particularly well supported. Dean again provides the specifics with Canfield the strongest direct dissenter and others providing varying degrees of doubt.

Says Dean, down center is hard, intense, harsh, strong, climactic, and final; up center is regal, aloof, noble, superior, and stable; down right is warm, informal, close, and intimate; down left is not so warm as down right, distantly intimate, formal, and introspective; up right is soft, distant, and unreal; up left is soft, infinite and ghostly.[63]

It can be seen how the qualities are related to Dietrich's (and others) ideas of relative strength of area. Dean has taken the ideas of strength one step further and

---

[63]Dean, op. cit., p. 212.

suggested that each area has certain potential for specific feeling. He doesn't try to explain why, whether these qualities somehow derive from the way the audience views, or derive from the audience's association of areas with scenes usually portrayed there.

Canfield is quite explicit in his opposition to Dean's view, without being any more explicit than Dean as to his reasons. He says that Dean felt intimate love scenes should be played down right regardless of the setting or context, and that such meanings of stage areas are only subjective and cannot be argued.[64]

It seems that both men may overstate their cases. Obviously Dean could overcome part of Canfield's objection by stating that he (Dean) would supply the down right area with the appropriate furniture or scenery for a love scene, not that he would play it there regardless of the scenery. But the claim of subjective meaning is more difficult, perhaps impossible, to oppose--or maintain--without extensive controlled testing.

3-Stage Areas: Opposing Views Harmonized. However, for the purposes of this chapter the important step is to try to come up with a norm of expert opinion, and that norm may best be found by trying to relate, or harmonize, the opposing views in some creative way.

---

[64]Canfield, op. cit., p. 135.

There seems to be an inversion at work. Taking a closer look at the qualities that Dean indicates are communicated by an area to scenes that are played in that area, it seems possible that the process originated in reverse, that scenes played in an area have gradually attached their meanings to that area. Perhaps Dean, as director, presented many scenes on stage in the order in which he would like them to appear strong or weak, according to generally accepted views of area strength. If down right is considered to be third in order of strength, or fourth in order of weakness, it would seem appropriate in many cases for him to play intimate (close to the audience) and soft (less strong than down center) scenes down right. By consistent choice of strong and weak areas for various types of scenes Dean or any experienced director may have gradually established cliches of appropriate areas for different kinds of specific moods. After years of such presentation, both he and his audiences may begin to associate these areas with the qualities inherent in the scenes usually played there, supported by the more tenable relations of strong and weak, or varying degrees of emphasis, in area. Ultimately, the result would be to feel that the areas have inherent emotional values which they contribute to the scene. In fact, if the above analysis is correct, the areas would ultimately have inherent values, but only by association and learning, only as symbols established by usage and based on a compositional truth.

The conclusion of a discussion of areas, for purposes of establishing a norm, might be to suggest that Dean's list is a very helpful one for the director who is trying to decide what strong or weak areas of emphasis might be appropriate for certain scenes. Dean's list will start the director's imagination working to consider, for instance, whether or not a particular love scene is one which should have the degree of strength found in the down right area.

4-Other Aspects of Emphasis Combined With Stage Areas. As a minimum, then, it would appear, by implication, that all authors would agree that the emphatic element in a composition can have varying degrees of strength according to the areas used, and also that the less emphatic elements can have varying degrees of strength in relation to the most emphatic element. For example, a character isolated from a group will be emphatic; if he is in a strong area while the group is in a weaker area, he will be emphatic and strong while the group will be less emphatic and weak. Conversely, if he is in a weaker area he can be emphatic but weak. Such weakness or strength can connote emotional attitudes toward the character; he can be dominant or subordinate while emphatic. He can generate sympathy or disdain in weaker areas; fear, awe, or dignity in stronger areas. Of course, the specific emotion becomes a contextual matter, all that can be said now is that the position can show the character to be at least weak or strong while being emphatic.

Shared positions with an emphatic area can share strength or weakness while sharing emphasis; and if areas have emotional connotation such as Dean suggests the characters can share those attributes as well. Beyond these meanings, the director may need human bodies and their posture and facing to make the meaning of emphasis more specific; he will no longer be dealing with meanings of abstraction but of elements in a concrete context.

3. Picturization in Motion and Its Suggested Meanings, According to the Authors Selected

Picturization in motion partakes of most of the meanings of picturization at rest. However, there are certain special ways in which picturization elements apply to motion that need further clarification. Mass will not be dealt with in a separate section below since mass means little more in motion than it does at rest, specifically, the impression of weight. The changing shape of mass concerns line and form in motion, while line in motion usually is the path described by form in motion. In turn, form in motion concerns both the changing shape of forms and the moving position of forms from one stage area to another. As the forms move they change emphasis both in the internal relationships of parts of the form but also in strength, and possibly emotional connotation, as they move in certain directions into new stage areas. And as forms move they adopt patterns of repeated beats, or rhythms.

Balance in motion has been discussed already in the section on picturization at rest. Rhythm and tempo will be discussed at more length in chapter four on meaning in context, since it seems that rhythm, even more than other abstract elements, depends upon, and derives its meaning from, its context. Therefore, what remains to consider here are the special meaning aspects of abstract line, form, emphasis, and rhythm in motion.

a) Line in Motion.--There seem to be two general purposes for line in motion. The use for the creation of mood and emotion is to be distinguished from the use to create emphasis and balance. Such devices as dressing, balancing, and the curved approach, as discussed by Dietrich (and others), are basically not line patterns to convey meaning but to maintain visibility of a primary character, to maintain a balanced composition, or to maintain emphasis upon the character or object that is conveying the meaning.[65] The curved approach to place the moves in a more or less emphatic position is not the same as the curved move to convey whatever emotion is connoted by a curved line; however, a particular curved move may well serve both purposes. 1-Meaning of Line in Motion. This study presumes that the actor may create in time and space whatever shape and meaning a painted line may create in space alone. However, the

---

[65] Dietrich, op. cit., p. 130.

special meaning of moving lines is little mentioned except
by Smith and Dean. To Dean, movement along lines (hori-
zontal, perpendicular, and diagonal, either straight, curved
or broken) has the same emotional meanings as he lists for
graphic, or still picture, lines.[66]

Moving line meaning has already been discussed as
approached by Smith; specifically they are his group move-
ments determined by such images as encircling, punching,
siding, and separating. Other metaphorical bases for line
meaning may occur to the director once he is given the basic
suggestions of Smith.

Dolman has an interesting theory as to why slow curving
lines, such as the parabola, hyperbola, and ellipse, are
more pleasing and natural for stage purposes than straight
or circular. His idea is that straight and circular lines,
or moves, require artificial tensions to be maintained.[67]
The theory seems to be based primarily on an analogy from
physics; in the case of a circle, that a centripetal force
must operate against an equal and opposite centrifugal force
to maintain a circle; such equal tensions would have to be
contrived. Similarly, straight lines seem to need both
pressure from behind, to keep them moving, and equal and
opposite pressure on both sides, to keep them straight;
again these, he maintains, are very contrived pressures. He

[66]Dean, op. cit., p. 256.

[67]Dolman, op. cit., p. 71.

might also have in mind images from his experience. In nature the straight line and the circular curve rarely, if ever, exist, even approximately; some form of gentler curve is more normal. So by analogy and abstraction, if he transfers his real life experience to the stage, the irregular curve appears to him as more natural.

As Dolman points out, pleasing lines are more often the lines akin to the shape of suspended rope rather than to the artificially straight.[68] Of course if a composition is to admit balance primarily because it is pleasing, it ought also to admit slow curves if they are more pleasing than straight lines.

Dietrich offers an equally interesting, though apparently opposite, view to illustrate how the "ideal" line of movement can depend upon what image the director chooses.

His premise is that humans are prone to conserve effort, that is, to take the shortest route to a point of interest.[69] Earlier, he suggests a chart for all the possible moves in relation to a point of interest; the moves are all charted as straight lines and are primarily toward, away from, or passing by a point of interest.[70] His use of the curved line is largely, as discussed above, for countering or balancing the primary move of another character.

---

[68]Ibid., p. 69.

[69]Dietrich, op. cit., p. 127.   [70]Ibid., p. 124.

It may be of value to point out here a curved move in relation to a point of interest, Smith's "symbolic" use of the curved approach in the metaphor of encirclement. It seems that in nature a man may well walk around an object of interest not merely away from, toward, or across it. This circular movement in relation to an object is found in nature; the move also fulfills the rule of efficiency, in terms of the man's purpose, without being a move in a straight line.

It seems that Dietrich's principle is drawn from human nature, or psychology. That the human being seeks the most economical means of accomplishing his goal may be true, but it seems that the straight line is too mathematically efficient, as well as too metaphorically mechanical, to be typical of the human, as both Dolman and Smith seem to suggest.

In certain dramatic situations there may be good reasons, either metaphorical or motivational, for a character to move in something other than a straight line. He may have mixed motives; hence an indirect line of movement may be expressive of his indirection in motive. Or he may be direct and efficient but in a graceful way, which may well involve movement in slow curves rather than in straight lines. A character may even move in mixed patterns, possibly by starting his move in a curve and ending his move in a straight line to indicate a change in his purpose or point of interest.

It seems to this study that the efficiency metaphor is a good one, but that it derives more from mathematics than from behaviour, hence derives its meaning from metaphor more than mimesis; the straight line is the shortest distance between two points. In effect, drawing upon another metaphor, a cable approaches a bridge pier in an arc that is probably parabolic in shape, yet is efficiently connecting two points directly. Efficiency may not always entail a straight line.

There seem to be three basic ideas at issue in the discussion. The first is that the shape of a movement may have emotional meaning apart from a specific context. If it does, then one consideration in selecting the line of movement should be its expressive appropriateness to the scene. If straight lines, intersecting patterns, or specific curves express differing moods or emotions, then they should be worked into the movement pattern for non-psychological reasons.

The second idea is that efficiency and grace are involved in line of movement; the straight line seems to suggest efficiency, the curved grace. Again, the qualities of line might better be chosen according to the attribute of the character and the scene rather than for either of these reasons of graceful appearance or efficiency, unless, of course, efficiency or grace are attributes of the moving character.

The third idea is likeness to nature. Perhaps a compromise may be effected here. An absolutely straight line, or even the appearance of it, perhaps never appears in nature; to make it appear on stage would seem to require of the director a symbolic reason. However, the appearance of directness and efficiency are certainly natural patterns in some human behavior, and when human motivation is direct then the line of movement may be direct as well without being necessarily precisely straight.

Line patterns in movements, then, may convey emotions or moods at least as much as line patterns do in graphic art. Patterns may carry connotations by metaphorical reference to something in nature or culture, or patterns may merely express the line of movement most suggestive of the line a similar movement would take in real life; in other words, the abstract line pattern may derive meaning from mimesis, metaphor, or symbol.

b) <u>Form in Motion</u>.--Form in motion would have meanings parallel to those of form at rest. Movement in symmetrical or asymmetrical, regular or irregular, or shallow or deep forms also convey the emotions that correspond to these forms at rest.[71] It can be inferred that mass movements that change from one form to another change meanings according to the meanings of the two forms.

---

[71]Dean, <u>op</u>. <u>cit</u>., p. 257.

The movement in transition itself can also have special meaning through the numbers, sizes and directions of movements of the parts of the moving form. To the extent that the form is massive its movement connotes power. If parts of the moving form move together the power is accented and increased; if parts move separately, the power is in opposition to other power or, as Dean puts it, in turmoil.[72]

c) Emphasis in Motion.--According to the authors studied, as form changes, or as it rises or lowers, or as it moves about the various stage areas, often following some line pattern, the form's meaning changes through the varying emphases it receives. The primary change is in strength and weakness. Whether or not the changing emphases have any more meaning than changing strength depends in part upon whether or not Dean's meaning of stage areas is accepted. At least there is a certain amount of agreement concerning the relative strength of emphatic movement.

1-Emphasis for Strength and Weakness. Strength and weakness are the qualities of movement most discussed by the authors represented. Relative agreement on most points is apparent though some quite interesting variants occur.

In some ways it seems that emphasis with abstract compositional principles and emphasis by stage areas may be separate in meaning such that they may work in mutual support or in counterpoint. By the degree of isolation,

---

[72]Ibid.

centrality, convergence, or stage level the degree of focus upon a character or object can be established. By the choice of stage area and direction of movement the strength of an object or character can be established. Hence it may be possible to portray through picturization in motion, by emphatic elements alone, a character who appears at the same time both very important and very weak. If the reasoning is correct it points out the possibility that emphasis by abstract compositional elements has but slight connotation of strength or weakness when compared to the strength or weakness of stage areas or body facing.

2-Emphasis by Level. Selden points out that a rising character is strong because it is opposing gravity; a falling character is weak because it is succumbing to gravity.[73] Dean agrees with the strength of height but observes that change of level from lower to higher is often neutralized as a strong move because it is going upstage and away from the audience.[74] Of course Dean is writing more of actors who are ascending scenic elements, such as staircases, while Selden is writing more of actors who are in the process of standing up or sitting down. Still the two authors seem to be in fundamental agreement, though Dean's caution is an important one: rising, by itself, may increase strength, but rarely is any actual stage move a simple one, and one meaning principle can nullify another.

---

[73]Selden, op. cit., p. 276.   [74]Dean, op. cit., p. 226.

3-Emphasis by Stage Area. In the case of movement between areas most authors agree that an abstract move is strong when it is made from a weaker to a stronger area; it is weak when made from a stronger to a weaker area. The relative degrees of strength are achieved by the amount of change involved and the strength of the area in which the move concludes. As Dietrich points out, scenes can be made relatively dominant by the sequence of stage areas used;[75] that is, the scene moving from a weaker to a stronger area constitutes a strong move to a stronger position, and hence makes the action of the new scene more emphatic than the action of the old.

A certain problem arises in Dean's application of the principles described above. Dean writes that the strongest move is from up center to down center, and the next strongest move is from up right to down center, while the weakest move is from down center to up right.[76] Note that there is a slight discrepancy between these moves and the principle that the strongest move should be from the weakest to the strongest area. Up left is stated to be the weakest area by both Dietrich and Dean, and so it is expected that the weakest move would conclude in, and the strongest move commence in, the up left rather than the up right area. And so it would if a director conceives of movement as

---

[75]Dietrich, op. cit., p. 108. [76]Dean, op. cit., p. 224.

merely the bridge, or dissolve, from one position to another. The problem seems complicated by the influence of natural eye movement in reading. The problem is more complicated still inasmuch as eye movement can be brought in evidence for either view point.

There may be a real inconsistency here in Dean's theory; at the very least there may be a problem in terminology. First Dean states that a move from up right to down center is the strongest. This would be a movement that moves simultaneously toward the audience and from the audiences left to the audience's center. Later Dean states that the move from left to right is the stronger move (from audience's right to audience's left).[77] To be sure there is no mix up of audience left with stage left, his reasoning follows: The eye movement in reading goes from left to right (i.e., stage right to stage left); therefore a movement from stage left to stage right opposes the natural direction of the western reading eye movement. Opposition makes the move strong. Stage movement that harmonizes with the eye movement is weaker in that it does not involve opposition. If this latter principle is correct it would seem he ought to revise his first statement concerning the strongest move; the strongest should be the move from up left to down center; then it would also be from weakest to strongest area and in opposition to eye movement.

[77]Ibid., p. 229.

Ther

sist

'str

is a

next

the

eye

ani

Sub

con

qu

ha

in

th

There seems to be no easy solution to his seeming inconsistency.

There also may be some doubt concerning the use of "strong" in terms of "opposition to eye movement." There is a possibility that stage movement supported by eye movement is strongest. Different terminology may help solve the difficulty. Perhaps the stage movement in harmony with eye movement could be called peaceful, correct, or harmonious, and hence could create a feeling of flowing with the stream. Such a move might have the strength of "rightness." To be contextual, by way of example, such a move in harmony with eye movement might be made by the "good guys" who are in harmony with audience attitudes. While, on the contrary, the strength of opposition, opposing the direction of eye movement, might well be reserved for the strength of the "bad guys", those characters who are in opposition to the view of the play or the audience. If this harmony-opposition view has any significance, the view would reverse Dean's specific suggestions where he writes that the army going against the eye movement is stronger and is psychologically expected to win.[78] The contrary of his view might well be true, namely that the army moving in harmony with audience eye movement has the support of the audience and is expected to win.

---

[78]Ibid., p. 231.

In summary there is general agreement that from weak
to strong areas are strong moves, and to a lesser degree it
is agreed that eye movement in reading has some effect upon
strength and weakness of moves from side to side. The
strength of moves directly toward an audience as compared
to those that move across the stage provides an area of
controversy.

4-Emphasis by Diagonal Movement. The director has one more
decision about emphasis to make before he can choose what
sequence of areas and directions of moves he wishes, a
decision about the meaning of the diagonal line. Dean and
Miner seem to offer the alternatives well.

Dean, it has already been seen, feels that strong
moves are across stage, because they cover ground, and
downstage, because they come toward the audience. Diagonal
moves, he feels, are some sort of "bizarre" mixed form and
rarely used;[79] and in any case are weaker than moves down
or across stage.[80] Miner, and others, on the other hand,
advise that the line of action is never horizontal or
vertical but diagonal.[81]

It would seem that Dean is in the minority at this
point, and that an application of his own principles, a
combination of obvious distance covering, toward the
audience and from weakest to strongest area would result

---

[79]Ibid., p. 197.   [80]Ibid., p. 232.

[81]John Gassner, Producing the Play (rev. ed; New York:
Dryden Press, 1953), p. 257.

in the diagonal move as the strongest line of action.

A decision about the significance of the diagonal would
have to be made by a director before he could decide what
is the strongest move to reserve for an individual in the
most climactic scene, and the strongest shift in location
from one playing area to another to reserve for the most
important change in the play content.

5-Summary of Emphasis in Motion. In conclusion, the consensus
seems to be that the strongest stage move is on the diagonal,
toward the audience and across the stage at the same time,
from up right to down center. Additional support is given
to this conclusion by the following reasoning, drawn from
principles already given: a movement across the stage is
apparent, i.e., obvious movement; the cross can be easily
seen to cover distance. On the other hand the directly up-
to-down stage move, moving directly toward the audience,
does not appear to cover much distance. Further, if move-
ment is more attention-getting than stillness, then
apparent movement should be more attention-getting than
apparent stillness. Generally, then, the cross is stronger
than the up-to-down stage move as far as getting attention
is concerned. And yet the full face of an actor, approach-
ing the audience to the focal point of the stage, down
center, is stronger than the profile of an actor moving
in Dietrich's indifferent-to-the-object-of-interest (the
audience in this case) relationship, the cross. Supposedly,
combining the strengths of these two moves produces the

strongest move, the diagonal. Of course Dean, as has been
seen earlier, distrusts the diagonal move and seems to
suggest that possibly it loses the strength of either of
its component moves and is possibly weaker than both.[82]
Although the chosen authors do not solve the problem this
way, it is possible that a curved diagonal cross, ending
with a move directly down stage at the center, on an
elevated stage level could be the strongest move on stage.

d) Rhythm in Motion.--In a sense, to say "rhythm in
motion" is to be redundant in that repetition in time of a
particular grouping of accented and unaccented beats
constitutes rhythm. In a sense, then, rhythm implies motion.
However, since certain artists have adopted the word rhythm
to apply to the still picture, what this study has been
calling static rhythm, or sequence, some designation is
needed to differentiate still picture rhythm from rhythm in
time. Rhythm in motion will serve the purpose.

Rhythm first needs to be seen as related to the other
elements in composition rather than as some superimposed
attribute. In fact, some kind of rhythm may be unavoidable
in moving composition. Forms, composed of masses given
shape by line patterns, may move in relation to each other
and in relation to the audience. This movement has to take
place in time. Various segments of a form, unless moving
with absolute smoothness and simultaneously at the same

---

[82]Dean, op. cit., p. 197.

speed, will provide some sequence of accented and unaccented
beats. If that sequence is repeated, a rhythm has been
established; if that rhythm continues at a relatively con-
stant speed a tempo has been established.

For the purposes of this chapter the study needs to
discover if, apart from any specific context, there are any
meanings that seem to be conveyed by rhythm in general and
by certain rhythms in particular.

In general, Dean feels rhythm communicates vitality,
order, coherence, and power of attraction.[83] Rhythm, in
effect, ties the production together, gives it all the same
flavor, and serves as a basis for a unified empathic response
from the audience. In other words, rhythm, thought of as
abstracted from life processes such as the heart beat and
lung breathing, connotes life in a play.

In specific, Dean feels that certain rhythms have
certain potential for more exact meaning, meaning in the
sense of conveying certain moods or feelings. The major
determinant of the kind of feeling is the placement of the
accented beat. For example, three beats generally convey
smoothness, gentleness, restfulness, and quiet. Within that
measure an accent on the first beat connotes formality and
definiteness, while an accent on the third beat connotes a
lift, or a lilt. Four beats connote regularity, heaviness,
or impressiveness. An odd number of beats connotes uneasi-
ness and restlessness. A longer measure of, say, six beats

[83]Ibid., p. 284.

connotes, with a final accented beat, grandeur, and tension or suspense with a fifth accented beat.[84]

Of these studied Dean is the only author of a play directing text who suggests such specific meanings to rhythm. It would seem that those meanings would require the same warning, and supply the same family-of-meanings value, that this study has suggested for Dean's specific meanings of stage areas.

4. Summary of Picturization

It seems that little more meaning can be gleaned from abstract formal elements by themselves. After considering the elements in isolation, in combination, at rest, and in motion this study must now consider them in the context of a play production.

CHAPTER III

PRINCIPLES OF MOVEMENT IN THE CONTEXT OF A PLAY

A. Introduction: Areas of Concern in the Relation of Movement to Context

This chapter is concerned with the analysis of a script in preparation for blocking. First it deals with the question of how much pre-plotting of movement a director should do and then it sets up an additional classification system. Movement in the context of the play still fits the four part classification set up by this study: abstract, mimetic, metaphoric, and symbolic, but an additional principle of order arises. The order in which a director analyzes his script for movement and uses his analysis in rehearsals. Two separate systems of classification then will be used simultaneously.

Finally the chapter deals with general principles of relations between the script and gross blocking that ought to be considered by the director before he actually plots movement in a context.

1. Abstraction, Mimesis, Metaphor, and Symbol in the Context

From his script the director often tries to derive metaphors and symbols to help him interpret the major moods and relationships in the play, the moods of the stage setting, and his resultant over all blocking scheme. After

94

such decisions about theme, mood, abstract line, form,
balance, and rhythm, color and style have been made the
director usually makes decisions about the sequence of stage
areas and major gross moves that will be appropriate to the
context. Not until after this, and often not until re-
hearsal, does he become concerned about moves that are
mimetic. Of course, among practicing directors there is a
large range in order of procedure. The purposes in
suggesting this particular procedure are, first, that it
reflects the order in which most directing texts present
their ideas about the meaning of movement in context, and
second, it shows the relationship between the kinds of move-
ment and the process of analysis undergone before actual
blocking begins. In practice, at any step in the rehearsal
procedure any of the four ways in which movement conveys
meaning may be introduced into the process; but for analysis
this study will adopt the order of the metaphor, abstraction,
and symbol preceding the mimetic.

2. Contribution of Movement to Context, Context to Movement

How context and movement contribute meaning to each
other is a highly diffuse and complex subject. Which
meaning is the derivative one is often the big question.

In this chapter one of the tasks is to discover opinions
about how much of the meaning of a movement is merely derived
from association with its context, how much some inherent
meaning of the movement contributes meaning to the context,

how much the context may alter any basic formal movement meanings with its specific, strong association, or how much the movement may alter the basic meaning of the context. This approach may help to decide how much a director can editorialize on a script by his direction of movement, and how much the script is determining the meaning of whatever movement he employs.

Most of the authors studied are concerned with a wide variety of relationships of movement to context including the relationship of movement to interpretation of the French scene, of the motivational unit, of the dynamic exit or entrance, of the emphatic line, of the kind of dialogue, of the clarification of a line, or of the emotional or aesthetic basis for a scene. The total job of picturization in context, of course, involves the added complication of the posture of actors, character motivations, business, and characterization details.

A new variety of associative meaning comes into being once a move is seen in the context of a play situation. What might have been previously a simple strong or weak move, graceful or abrupt move, now takes on specific modification. The same move may take on the coloring of the context. Given an angry character who makes a strong move in a conflict situation, the strong move becomes an angry strong move. By association with the situation the move is thought by the audience to portray the specific emotion of the situation. By association a move may be interpreted by

an audience to convey rather refined feelings. In effect,
an abstract aesthetic meaning is superceded by a specific
physical meaning. Before the context the move only expressed
a very general tone, or mood, or a formal relationship;
with pantomimic context the move is given qualities by its
resemblance to natural or social contexts, or by psycho-
logical factors in the way our senses and body react to
physical phenomena; and given a verbal and action context
the move is given a specific relationship, and appears to
be a move with a specific meaning.

Also involved in the relation of movement to context
is the basic problem of whether the still picture or the
moving picture may best contribute meaning to a particular
scene. The difficulty is in finding anything like a
consensus while being inclusive of all the representative
opinion. However, this section is perhaps most important
in its implications for further development of a theory of
the relationship between the meanings of motion and of rest
in the stage picture.

About the relationships between movement, still picture,
and the script, Dean says, in effect, if sight and sound
factors are competing for attention usually the sight
factors will win. If what is in sight is also moving then
it has an even greater advantage. Movement, then, is more
powerful than speech, and if both are going on together the
movement will get the focus.[1]

---

[1]Dean, op. cit., p. 238.

He further states that pantomimic movement will tell the story of the play more powerfully than the words, because man is more impressed by sight than by hearing.[2] Selden supports Dean's view by writing that gesture may obscure words since the visual is stronger than the auditory.[3]

Smith, on the other hand, states that the ear is quicker than the eye in the theatre, thus suggesting an alternative view.[4] In effect, Smith's statement does not deal, as does Dean's and Selden's, with the factor of strength or weight so much as with speed. A movement takes time to perform and hence time to create its impression on an audience. Also the audience eye needs time to change its focus from one person or action to another. To explain by a specific example, it is quite possible, in fast repartee dialogue among several characters, for the audience to lose track of who is speaking. A new voice will be heard, but before the eye can locate the body, the dialogue has passed to a new character. The relative speed with which the eye or ear may comprehend, then, is in a different category from the relative force of impression made by that which is seen and heard, with the seen more forceful than the heard.

B. Principles of the Director's Control Over

Relations of Movement to Context

From the outset, opinion would have it that the
director must control movement carefully or movement may
obliterate, confuse, or assume dominance over the script.
According to various authors the director, as will be seen,
has two general directions in which to go. If he declares
script supremacy he may either plan his movement carefully
to harmonize it with the script, or he may deny himself
this powerful tool of movement, suppressing it for the
weaker, though more subtle, complex, and intellectual, tool
of the words. There is, in fact, a third choice taken by a
few authors: the director may let the movement occur as the
actor improvises it and edit it as the director's instinct
dictates. In effect, the latter usually accompanies a
different view of the play, namely that the actor and his
character is supreme, not the director, the production, the
script, or the audience.

In the actual job of analysis of the script most
authors agree that the script should dominate the director's
movement. But how much planning of that movement the
director should do in advance of rehearsal, even in analysis,
is a subject of controversy.

1. To Plot or Not to Plot

Before discussing how the director may plot his blocking

to fit his analysis a large body of opinion needs to be summarized concerning how, or even if, a director ought to plot that movement. Opinion seems to range from Hopkins' procedure of letting the actors roam about the stage and letting the stage business be born from their actions,[5] all the way to Bricker's procedure of planning in detail all movement and business before even casting, and then committing all blocking to memory before the first rehearsal.[6] Then to complicate his opinion Hopkins also says that every move should mean something, and that the director must know exactly what he wants; the director simply should not let the actor know he is being directed.[7] Though Hopkins seems to express the most extreme anti-plan view, his practice seems to suggest an iron directoral hand under a kid glove of seeming actors' improvisation. Bricker's reasons for the extreme view of planning is basically similar to that of more conservative planners, to insure a meaning to the movement and stage picture; however, he leaves it to others to suggest a method of directing and a meaning for the resultant movements.

The shades of opinion are as follows: Edwin White believes the director's job is both interpretive and

---

creative, not imitative; the movement of a script should follow the mind of the director for each new production.[8] C. B. Purdom suggests that all movement be worked out at the start; to rely upon inspiration at rehearsals is a weakness in the director; still a director should not be rigid in the application of his plan. In brief, he feels that intuition is no substitute for technique, and technique does not depend upon rehearsal improvisation.[9]

Harold Clurman declares that the director is the "author" of the stage action; that theatrical gestures and movement comprise a different language from that which the playwright uses; and it is the director who is the master of theatrical action.[10] In practice Clurman is consistent with his theory; from his notes about directing Member of the Wedding it can be seen that he has created in detail the movement pattern, gestures, and mood, as well as the background of the play and of each character before entering rehearsal.[11] At first there seems to be an inconsistency in that he states his method is to get these elements from the actor; a closer look discloses, however, that his method does not mean the discarding of a plan. In effect, Clurman

gets from the actor exactly what Clurman has pre-planned, a procedure which may save the self-esteem of a temperamental actor but is apt to be costly in time and efficiency.

Bernard Shaw, as might be expected, believed in pre-planning all moves,[12] as did Jacques Copeau.[13] While Jean Vilar declares that to compel an actor to integrate voice and body into a pre-determined harmony or plastic composition smacks of animal training.[14] Of course Vilar fails to discuss the possibilities of pre-planning in Clurman's style, which does not force anything upon the actor, but in fact Clurman agrees with Vilar, that it is an appalling fault in a director to insist pedantically upon a particular inflection or movement in a particular part of a role.[15] It is of side interest, perhaps, to note that Gassner quotes this permissive passage from Clurman's writing but not the part that insists on the complete planning by the director. It is, after all, no more absurd to expect exact movements from an actor, planned by a director-artist, than it is to expect exact words from an actor, planned by a playwright artist; to repeat Clurman, the director's role may well be that of author of the action.

Robert Lewis declares that a good director works out a plan, a design; and bits and pieces of the design cannot

---

[12]Ibid., p. 193. [13]Ibid., p. 217.

[14]Ibid., p. 267.

[15]Gassner, op. cit., p. 297.

be altered very often without destroying the basic spirit of the whole production.[16] Stanislavsky, employing an improvisational technique both with movement and dialogue, nevertheless was a careful planner and a stickler for detail. It is true improvisationally he believed in changing scenery and floor plan to keep the movement fresh and changing in early rehearsals;[17] what is sometimes forgotten, however, is the length of time he used for rehearsal. Referring only to his works on acting will make the reader think that the director simply made the actor think, recall, and feel. Reference, however, to his directions, for example in Stanislavsky Produces Othello, will reveal that he preplanned every detail of his plot and character background as well as very specific movements and business details that resulted from his analysis.[18] His methods, not unlike Clurman's method of drawing things out of the actor, merely required more time in order to draw from the actor Stanislavsky's own preplanning. Of course, conclusions such as the above need more documentation than is given here; but since his point of view is not central to the theme of this paper, it seems sufficient to refer the reader to Stanislavsky's production notes on Othello for confirmation.[19]

Dantchenko maintained that the director gives the actor everything, and the actor's job is to enter into the life of all the specific instructions given to him.[20] Dantchenko warns, however, as does Hopkins, that the actor should not, by the time the play is in performance, know what has been given him, because he has made it so much his own. Dantchenko's point of view is substantially that of this study. Generally, the competent actor has enough to create and enough to achieve so that he is most willing to accept the blocking and detailed suggestions of a competent director. In fact, he usually takes pride in being able to make almost any direction look like his own invention.

Miner starts by decrying the didactic method of direction that makes an actor "parrot back" in stale obedience,[21] and concludes by advising that the moving pattern of the play should be worked out before rehearsals start.[22] The presumption is that he counsels persuasion and a certain flexibility combined with preplanning. Again it seems pertinent to wonder why Miner uses the emotionally toned words; he doesn't seem to think the actor has to "parrot back" the playwright's words even though they are usually rigidly pre-determined; yet he does seem to think the actor would have to "parrot back" the director's movements if they were predetermined. It seems that Dantchenko's

view of the actor-director relationship should settle the problem. If the actor knows his craft, he ought to be able to make the director's pre-planned movement seem to originate spontaneously from the character portrayed.

Smith says the director is like an artist designing a picture.[23] Of course to carry that image further, it would be absurd for the pigment and the canvas to determine their own pattern; however, some modern canvas artists in fact let the pigment do just that.

Dietrich feels that the basic purpose of the play production process is to give every talented person a chance to contribute the best that is in him, and that such a purpose is defeated with a dictatorial director.[24]

It must be realized, of course, that the above purpose, whether intended or not, is stated in terms of educational or community theatre. Giving every talented participant a chance to contribute is not the primary purpose of professional theatre though it may be the method used by some professional directors. Giving such participants a chance may or may not produce a unified blocking scheme, may or may not result in a clear pattern of movement communication to an audience; however, giving the participants their chance probably will result in an opportunity for them to practice what they have learned, to experiment with something new, and to learn more in the process. Such are admirable

goals of educational theatre. In professional theatre, giving competent actors a chance to contribute from their experience may result in good theatre, but it still may result in a disunified or unfocused movement scheme. In any case, the primary purpose of professional theatre seems to be to please an audience. A participant's contribution is only pertinent to the issue to the extent that the contribution will or will not improve the product the audience sees; but the purpose is audience centered, not participant centered.

The important point this study wishes to make here is not to confuse purpose with method. A good director's method may be to utilize available talent to the fullest while still allowing the playwright to dictate the words at the same time the director dictates the movement. His primary purpose may be to give each participant a chance or to give the audience a unified impression, purposes which are not necessarily compatible or incompatible. In any event, this study is parimarily concerned not with participants but with whatever methods and principles will produce the most clear communication by movement.

Selden, like Hopkins, seems to want the best of both preplanning and spontaneous creation. First he declares that there is no "real" on stage; everything is presented in some degree of abstraction, so the director must create a planned pattern; he selects, orders, and heightens both

the gross movement and pantomimic effects.[25] Later Selden
maintains that the director cannot plan the design of the
movement; that it must flow from feelings and impulse,
though thought can enhance it.[26] The two sections appear
to be in direct contradiction to each other; but whether or
not they are, it would seem that design can flow from
feelings and impulse and still be pre-planned. The feelings
and impulses conjured up by an experienced director,
imagining the script in action, and using techniques of a
language of movement, are apt to be at least as reliable as
either the director's or the actor's impulses on the spur
of the moment and under the pressure of the time when the
play first gets put on its feet.

Dean, the most outstanding proponent of the specific
meaning of movement, and of the director's obligations as
artist and planner, still advises caution in rehearsal and
planning. In fact, the method he proposes seems to back-
track on his other principles; it is to plan the general
tonal qualities of the various scenes but to wait until
blocking rehearsals to specifically compose the pictures,
moves, business, and rhythms.[27] His reason is that pre-
planning in detail will tend to stamp all the director's
productions with the director's character. He has a point,

but the opposite is equally possible; improvising by the director during rehearsal may well result in reliance on the same cliches of movement and interpretation the director has used before. It would seem that careful planning, by an intelligent director, would stand a better chance of new results, and of having moves that grow out of the needs of the particular play, then would improvisation.

Canfield takes the subject up in detail, considering many points of view quite sympathetically. His conclusion is a clear statement in favor of the recognition of the craft of the director and of the necessity for pre-planning;[28] to Canfield, pre-planning and a steadfast adherence to the planning through specific application is the only way to insure a unified production, meaningful picture and movement, and an exciting play that takes advantage of the director's analysis and experience. In general his view of the actor is that he can contribute a great deal, but from his own techniques and experiences. The actor must conform not primarily to some inner truth within the actor but primarily to the inner requirement of the play and the character. These inner truths may be subjective, but they can be as objectively planned as the script itself, for they are subjective truths of the character, not of the actor.

Throughout this discussion there seem to emerge two related but separate issues. One is whether or not to

pre-plan movement, and the other is whether or not to dictate movement to actors. One concerns careful application of principles and analysis, the other concerns how to communicate that analysis to actors. It seems to this study that the two issues are independent variables and can be put together, or separated, in any combination the director may desire.

The consensus, if there is one, may be stated thus: a director may pre-plan or not just as he pleases; however, he need not identify detailed planning with dictatorship, nor spontaneous creation with the appearance of spontaneity in performance. If there is any meaning to movement with its conventions, symbols, patterns, and pantomime, then the director is giving up a powerful tool unless he works out these elements carefully, and by some method insures himself that the actor uses the results of his careful analysis and plotting.

2. Phases in Plotting Movement from Guiding Concepts to Details

a) Summary of the Six Phases.--As compiled from authors and directors consulted, analysis and plotting seem to fit roughly into six phases. (1) Phase one is the director's attempt to find in the script a basic theme or image for interpretation. He decides what script elements suggest movement to him and conversely what movements will suggest script elements, i.e., what movements seem to be

suggested by mood, theme, structure, and point of view.

(2) Allied to thematic analysis, but different is character analysis: what movement factors are suggested by characters and their relationships in a play, as contrasted with what thematic ideas suggest. (3) In the third phase, based on his analysis, the director must plot his gross movement, or blocking scheme and design his basic stage floor plan. (4) The fourth phase may be to plot his fine movement in specific relation to lines of the script. (5) Fifth, he may plot the details of movement qualities in characterization, business or pantomime. And finally (6) the sixth phase is the plotting of the timing qualities of rhythm, tempo, and sequence.

It may be, of course, that a director does not work in this order nor even plot these elements. He may even leave much of this work up to actors, designers, or chance. The difference in method, however, would not invalidate the categories. Whether these relationships of movement or context appear on stage by planning or by chance, by director or by actor decision, there will still be a resultant movement pattern in some relationship to the script lines, and with some amount of business and timing.

b) <u>Principles of Theme and Image: Selection of Metaphors and Symbols to help Create a Movement Pattern</u>.-- The image, or metaphor, seems to be the most popular mode of communication to choose for play interpretation. Smith, and others, suggest that this choice should start with the

theme and what the play is trying to say, to suggest, to
sell, to teach, or to express. Choice should start with
the main forces at work and the conflicts involved. Per-
haps there are too many forces or themes in which case the
attempt is to consolidate them into a single overall ruling
theme. This main theme, and the nature of the conflict
relationships in the play, may then suggest to the director
both a graphic image and a line pattern to the play. The
abstract line and graphic image may then control not only
scenic design elements but the form of pictures and of
movements on stage.

1-Sources and Use of Theme. Canfield says that the tone,
style, and blocking should spring from the script.[29] Smith
suggests four basic elements to look for in the script:
theme, line, color, and graphic image.[30] McMullan wrote
an entire book about the way a director may find images in
his script to serve as tools for interpretation of lines
and movement; he suggests watching for plot movement and
finding images that will picture that movement in graphic
terms.[31]

Other authors, such as Hewitt, suggest that life
provides our main image or metaphor for analysis, the life
both of natural behavior and of convention.[32] However, the

[29]Canfield, op. cit., p. 131.   [30]Smith, op. cit., p. 7.

[31]Frank McMullan, The Directorial Image (Hamden, Conn.:
Shoestring Press, 1962), p. 57.

[32]Hewitt, op. cit., p. 11.

script may influence where in life the director looks for his image. MacGowan, for instance, in talking about certain European expressionist dramatists, draws attention to the specific use of metaphor in The Insect Comedy where movement patterns are derived directly from insect life.[33] In the same chapter, however, MacGowan suggests an internal rather than external search for metaphor by asking the director to seek his theme and his metaphor, and consequent movement pattern, from the inner truth of the unconscious mind instead of from the outer world of actuality.[34] MacGowan is not very explicit, however, in suggesting how the two resultant movements might differ from each other. He does, however, give examples. For instance, a red costumed chorus group may represent a blood stain on the stairs,[35] or a physical covering of cloth may represent metaphorically Napoleon's covering the glory that was the Bourbon's.[36]

Colby Lewis suggests that Jessner abandons external realistic verisimilitude in order to attempt to express man's soul.[37] An analysis of Jessner's movement seems to indicate a complex thrice-removed-from the truth stage picture. Actors stand for a blood stain on the steps, and

[36]Ibid., p. 137.

[37]Lewis, op. cit., p. 197.

the blood stain stands for a physical death, and the physical death stands for a spiritual death; however, such a distance from the ultimate meaning might make most audience members see only a pretty set of red costumed actors.

Reinhardt declared that the job of the director is to breathe life into the written word, to fill it with the blood of today in order to retain the spirit of that word.[38] Reinhardt, however does not supply his readers with the principle of analysis which must be used to arrive at the appropriate movement patterns. Perhaps he intended some principle such as Robert Lewis used to direct My Heart's in the Highlands. His image was a flowering plant that became analogous to a group in motion; a trumpet player "waters" the crowd with his playing, "the plant" grows and bears "fruit" in the form of gifts for the player.[39]

2-Subordinate themes for French Scenes and Beats. When analyzing the script the director will no doubt find many metaphors and many themes, all subordinate to the main theme and metaphor; in fact they will contribute to the finding of the main metaphor. These subordinate images are usually found in, and express, smaller units of the play variously called French scenes, paragraphs, sub-actions, or motivational units. It is into these units that the director usually subdivides his script to find meaningful

par-

tai

but

bea

is

a s

pl

tra

In

to

th

ur

m

c

s

c

d

s

parts that contribute to the whole. Harold Clurman maintains that a play is not constructed on lines of dialogue but fundamentally on a series of actions, which he calls beats, that are revealed through what a character wants or is driving toward.[40] Smith suggests that the "action" of a scene is a literary term concerning the movement of a plot by a succession of incidents; the action needs to be translated into psychical and physical terms and units.[41] In effect these units are steps in a character's progress toward a goal. Dietrich supports this view and calls these steps "motivational units."[42] In movement, these units are used primarily to devise combinations of still or moving pictures that are phrased, or paragraphed, for units of movement meaning. In effect, these units, or beats, are similar to a paragraph in writing. In it one action is carried out, or one incident occurs, or one subject is discussed, or one aspect of a purpose is pursued, or one step in a development is taken.

Let it be noted that there are really two different points of view involved in deciding what the content of a unit is. The two views may not necessarily result in the same division of the script into units. One view is motivational and the other is thematic. The latter is in terms of the play's or author's reasons or themes, the

s

s

a

a

p

D

a

r

former in terms of the actors. The points of view are not
only different in kind but may well be different in purpose.
The character intends one thing while the play may intend a
point of view about what the character intends. For
instance, the character may fulfill his goal in the progress
of a scene, but the play may mean to suggest that he should
not have. Hence, the metaphor and the movement may differ
somewhat depending upon whether the director uses as his
basic unit a motivational scheme or a thematic scheme.
Hopefully, a careful analysis will allow both purposes to
join in a single pattern that will interpret to the
audience the intention of both the character and the play.
3-Relating Subordinate Themes to the Main Theme. The next
step would be to decide how the theme and image of each
scene is related to the theme or image of each other scene
and to the theme of the whole play. The reason would be to
assure a variety in meanings with an overall unity of
purpose. Such smaller scenes may be divided, according to
Dean, into scenes of incidental action, of background
action, of main action, or of emotional relationship.[43]
They may also be divided into steps that range from low to
high, steps that chart the progress of a character toward
his goal, as Canfield and others suggest.[44] Another
division of scene types is suggested by Dietrich's list of

---

[43]Dean, op. cit., p. 209.

[44]Canfield, op. cit., p. 134.

basic motives; they may be scenes of response, recognition, adventure, or security wherein the basic character inter-relationship is typified by one of these drives.[45] Another list may also help in ordering the scenes, such as a list of the basic needs: sex, food, drink, air, and shelter. Or still other listings such as by emotions expressed or felt by the characters, or by moods inherent in the scene. In any event, at this juncture the point is to determine the basic themes and images of these scenes and to rank them in some order of importance, climax, vitality, or mood, to try to discover some progressive structure. The purpose of the latter is to decide how and where to stage the scenes.

Many authors suggest giving a scene a title in order to summarize for the director the central content and purpose of the scene. Such titling is akin to the selection of a theme or a metaphor for that scene. Canfield suggests titling[46] as does Dean[47] So, in fact, do many others. Also this study wishes to point out that either a title or an image may help to determine whether a scene will be static or moving. For example, the director may title his scene thus: George is surrounded by his admirers. He may also title the same scene: George in the process of being surrounded by his admirers, or George showing off more as

[45]Dietrich, op. cit., p. 12.

[46]Canfield, op. cit., p. 134.   [47]Dean, op. cit., p. 207.

his admirers close in. The first title suggests a still

picture and may result in a still picture blocking. The

second and third suggest moving relationships and are

apt to result in moving pictures in the blocking.

A similar set of alternatives for a scene might be

this: George forces Henry to come to a decision, or George

chases Henry until George corners Henry and forces him to

decide. Examples of course could be multiplied, but it can

be seen how from the start a director's choice of a moving

image or title, rather than a static image or title, can

influence the kind of movement or still picturization he

arrives at in his scene.

Similarly, the central image for the entire play can

be a major turning point for the director. It would seem

that in its choice he has started on the road to a static

or a moving play depending upon whether his metaphor is

static or moving. If he sees the relationships in the

play as, e.g., mountain and valley his play may stand

still. If he sees them, for example, as rushing stream,

pendulum, or cock fight his play may move. In short, if

he looks for the movement of the plot, the moving relation-

ship of ideas, and the moving character relationships, then

selects a moving metaphor, his task is easier when it comes

to the selection of specific physical movements.

This section concludes with the following observations:

a director may call attention primarily to changes in

process or to the static results of change. If he wishes

an

th

s

to experiment with the maximum use of his unique tool of movement he can at the outset materially increase his opportunities for success first by looking for moving themes, moving forms of expression, moving titles, moving moods, and moving drives when he analyzes his script and second by choosing a moving metaphor to depict the moving relationships.

c) **Principles of Character Relationships Yielding Possibilities for Movement Patterns.**--In this second phase of the director's analysis much has already been anticipated. The analysis of the relationship between character and character, the motivational, purposive, actionable relationships, have already been discussed while dealing with motivational units, or beats, to a play. Suffice it to say in addition that the director may well have a problem in translating his thematic unit into a motivational unit for the actor. The advisability of working with the actor in terms of the play's purpose or merely in terms of the character's purpose is a matter for the subject of psychology of learning. However, for purposes of analysis the director ought to understand the difference in units and be able to use both.

1-Relating Character Movement to Theme Movement.--The actor motivates his character using primarily psychological data; the actor must attempt to create the impression that he sees and feels only what the character sees and feels. The

i

v

r

i

author motivates his play usually using a much larger range of data and a much more objective point of view. Added to psychological purposes are social, ethical, aesthetic, and poetic purposes; even the psychological purposes usually involve the interrelated motives of several characters. In short, the purpose of one character in any particular scene is but a small part, and usually of one kind, of the author's purpose in that scene. More often it seems the author's purpose is to show something like the opposition of contending social forces or ideas as embodied in the several characters in conflict, rather than merely the purpose of one character.

Hence, for actors, the director usually needs to make a second script analysis, translating themes, images, conflicts, and sociological and philosophical data into the behavior and purposes of characters.

2-Combination, or Choice, of Psychological or Symbolic Outer Expression of Inner Truth. Certainly the modern theatre man seems to be much more concerned with psychology than philosophy. He is much more concerned with analyzing a play in terms of character and motivation than in terms of what the play says or how it says it. Even the non-illusionistic expressionist, who scoffs at presenting verisimilitude on stage is usually more concerned with presenting the "inner truth" of "souls" or minds or emotions rather than ethical, aesthetic, scientific, conceptual or even sociological "truth". The modern theatre man seems to

be more concerned with "truth to" than "truth about," more concerned with correspondence with than comment about, more concerned with the "is" than the "ought." He wants to depict reality, be it inner, outer, or otherwise, rather than to criticize reality. Of course there are notable exceptions; however, the greater amount of contemporary material in theatre concerns psychological reality, and there is a dearth or submergence of material involving symbolic expression and editorializing techniques. In fact an even more subtle lack is apparent. With the exception of basic text books on directing there is a real dearth of thematic analytical method and material. There seems to be a growing tendency toward forgetting the art and craft of theatre and a greater dependency upon the spontaneous psychological reactions of the director and the actor to bring the script to life. This particular psychological approach to play production, letting actor behavior on stage dictate character behavior seems to have the usual anaemic results of too much inbreeding. Character portrayals more and more resemble each other rather than unique human beings, because more and more the characters are evolved primarily from what the actor feels than from either the script or an understanding of how other human beings feel and behave.

The philosophical, or analytical, approach seems to be less in vogue. However, in all fairness, this lack may not be a real one but simply a reflection of the fact that

the

t

m

u

d

m

the practicing experienced director no longer thinks
consciously of the craft of his work but is always conscious
of having to deal with artistic personalities. His writing
may reflect his conscious problem more than his unconscious
practice.

Concerning the inner truth of character relationships,
the authors of directing texts seem to agree that a char-
acter's inner feelings must be given outer form. According
to Dietrich, a drama needs overt action; the inner must be
translated into observable action.[48] His previously
mentioned basic motives must find a physical, observable
expression. However the "inner" that is being expressed in
the "outer" may be expressed, it seems, in two basically
different ways. One is psychological and the other thematic.

The first derives from motivation. There is some inner
reason, drive, or imbalance that leads a person to seek
satisfaction or balance. That seeking is the overt result
of the motivation. From the outer form the seeking takes,
the audience is supposed to be able to discover both the
motive and the kind of solution sought.

Again, according to Dietrich, action means little
until we see the reason for it.[49] This study has already
discussed this idea in terms of the meaning of abstract
movement; however, it seems necessary to find out in this

---

[48]Dietrich, op. cit., p. 8.

[49]Ibid., p. 9.

section how the context may clarify the basic action. To
begin with, the move itself may be all that is necessary
in order to see the reason for it. Given a move with all
its pantomimic clarifications, that is, with its qualities
of line, and its relationship to other actors and to the
audience, then the pantomimic movement context is quite
complete. The move without a verbal context may convey
much meaning; however, the move with all of these qualities
is already in a context, though nonverbal, and is no longer
abstract movement.

The other basic variety of expressing the inner by the
outer may not deal primarily with the psychological but with
symbols. The outer form may be dictated by the line, image,
form, and pantomimic language symbols that are primarily
symbols abstracted from elements in nature; though symbols
certainly may be abstracted from human behavior. However,
there seems to be a basic difference in kind and procedure
between devising symbols representative of inner states and
devising illusionistic heightening of natural symptoms
drawn from a real life situation. It seems also, though,
that there is no reason why both levels of translation of
inner truth to outer form should not be used at the same
time without confusion. Dietrich and others write of the
illusion of reality, Jessner and others write of the symbol
of reality; the modern director may well use both.

3-How to Discover the Character's Inner Feelings. The study
turns next to discovering in the script what the character's

inner purposes are and how they can be transcribed into movement. Dietrich is a good starting point for a montage of opinion about discovering inner purposes to be portrayed by actors with their outer forms.

According to Dietrich, the director should look for the conflict in the scene, the drive of one character and the obstacles he is overcoming, obstacles usually embodied in another character. This conflict sets up an imbalance in the action of the play and provides the basis for his previously mentioned give and take of reaction, giving the director some internal movement to express in external ways.[50] These motivations of characters may stem from either internal or external stimuli;[51] there may be, in other words, an inner drive or an outer event that sets up the imbalance; or of course, there may be both. Obviously the director in the first phase of analysis must find the physical objects, or the characters, or the internal reasons that motivate the characters in order later to devise movement appropriate to them. At that time the director may discover it is best to have three different levels of "motivation" for every move. First, an internal reason within the character; second an external object to externalize the internal, to provide a point of interest, as Dietrich calls it, or to provide a destination for the

---

[50]Ibid., p. 158.   [51]Ibid., p. 147.

move; and third, a symbolic motivation, a reason dictated
by the meaning of the play by the underlying purposes of
theme, possibly expressed in graphic image.

4-How the Character Should Portray His Inner Feelings. On
the subject of how characters should portray their inner
feelings or the inner purposes of the play, there seem to
be two sharp divisions of opinion: by mimesis on the one
hand, and by abstraction, metaphor or symbol on the other.
The divisions might be labeled psychological and philosoph-
ical.

Robert Lewis feels that the form of a realistic play
exists in the successful scene-by-scene fulfillment of the
main intention of each character in relation to the theme
of the play.[52] Thus he combines both philosophical and
psychological reasons in his analysis. Jacques Copeau felt
that the best translation of inner to outer was by using
all of the abstract elements of line, mass, and shape,
combined with certain conventional symbols for human
behavior instead of abstracting behavior from nature.[53]
His way,the actor would accurately indicate his character
rather than present the illusion of character. To Copeau
such outer form, resembling moving sculpture, could con-
vey universal meanings rather than specific individual
characteristics. To Stuart Vaughn, universality is best

---

[52]Gassner, op. cit., p. 306.

[53]Dolman, op. cit., p. 182.

expressed by being really specific and detailed; and in the context of his writing appears to be suggesting the presentation of unique individuals, not "universalized" symbols of humanity.[54] His view would suggest that a well wrought, realistic, and believable, human being on stage stands for humanity better than an actor who attempts to portray characteristics which are true of all human beings but of no particular human being. His point seems well taken, but he perhaps understresses the possibilities of presentation of characteristics that humans have in common, characteristics by virtue of which they are all classified as human beings. Perhaps also, he neglects the possibilities in the alternate method of being specific and truthful, namely the method of using symbol, a form of sign language, as it were, rather than verisimilitude. Be that as it may, the rest of the opinions seem to line up on either side of this dividing line between the two external ways of expressing inner realities: symbol or verisimilitude.

Meyerhold, using his "bio-mechanics" system of body training tried to make his actors physically able to perform whatever was required by him. Such stage movements were not psychologically motivated, says P. A. Markov, but were displaying humans in large "poster" terms, portraying characteristics of society in its classes rather than of

---

[54]Cole, op. cit., p. 435.

individuals.[55] The results were evidently grotesque and exaggerated, and were said to resemble a form of modern dance. Meyerhold felt that truth was best expressed by sociological rather than psychological motivation. He preferred types to individuals as long as the types expressed the inner truth of society.

Kazan prefers to look to the script for psychological motivation, saying that directing consists finally of turning psychology into behavior.[56] It is interesting to note, however, from his discussion of Streetcar Named Desire that he in effect is turning sociology, style, poetry, and thematic play relations as well as psychology into behavior. In any event he decides what the essence of the character is so he can turn it into the behavior of the character. It is obvious already that the "essence" may not be a psychological essence to all directors.

For example, Harold Clurman also feels that every movement should be significant of an inner state, but his method of arriving at that movement is distinctly analogical; his inner essences are expressed in terms of metaphors, not psychology.[57] In discussing Member of the Wedding Clurman talks of Frankie's growth by twists and turns, hence he adds twists and turns to her movement pattern.[58] Other

---

[55]Pavel Aleksandrovich Markov, The Soviet Theatre (New York: G.P. Putnam's Sons, 1935), p. 73.

[56]Cole, op. cit., p. 364.

[57]Ibid., p. 381.   [58]Ibid., p. 382.

metaphorical images for her are "getting connected," "wanting to get out of herself," "wanting to go around the world," "straining to get out," and "a mind and spirit that leap."[59] These are all applied to Frankie's movement pattern. The director should find things to do that are, as Clurman puts it, "concrete embodiments of abstract ideas."[60]

These movements are not the abstract formal variety of Copeau nor the realistic variety of Vaughn. They supply to character movement the dimension of metaphor.

Note all three varieties of inner reasons may be applied simultaneously to any one movement. An inner psychological motivation may drive a character to a point of interest; the character may get there using a somewhat formalized body position and a floor pattern that together have abstract meaning and still may get there in whirls, leaps, twists, or other movements as suggested by a metaphor drawn from a mental, an animal, or a mechanical movement. In short, none of these views of projecting the inner into an observable form need be mutually inconsistent. The director may look for all of these possibilities for character movement in his script analysis and use all.

In using all of the above methods of analysis, and perhaps more, the director may be able to follow Selden's

advice completely and translate into outer form the total inner response that normally isn't seen.[61] Of course, Selden is really bringing into the discussion a problem of expression and communication; his concern is with how an actor can have psychologically motivated movement that is externally observable, and how an actor can be true to life, express natural emotional behavior, when most human beings have learned to inhibit this behavior. Most natural outer displays of emotion are no longer large enough for the stage.

MacGowan's opinion is that the actor should express the form, not the illusion, of reality.[62] The illusion-seeking is apt to neglect the form, and hence the thematic content, of the play. But MacGowan does not go to the expressionist's extreme; he feels the audience will understand the form of life better if it is derived from the actual psychological life the audience knows. He advocates a selected realism form of symbolism; the director might look for a real object, symbol, or activity that best sums up the essence of the scene or the character and use this to stand for the whole; i.e., one pillar stands for a colonnade. Thus MacGowan expresses a midpoint between symbolic and psychological expression of inner truth.

---

[61]Selden, op. cit., p. 93.

[62]MacGowan, op. cit., p. 120.

Worthington Miner maintains that the actor always comes first, over the director, the script, and the audience,[63] but in practice seems to subscribe to the director's use of symbolism as well. Miner's opinion seems to be that the inner motivation of the actor, the truth of his own natural responses, is to be primary in determining stage movement. His view would suggest not only a motivational approach to expressing the inner truth, but a distinctly improvisational method as opposed to pre-planning. But in practice, for example, he writes of a parallel set of stage movements that did not derive from inner motivation of the actor, yet did meet with his approval. The movements were made by two characters walking alternately in figure eight patterns. It is difficult to see how such a movement could grow from an inner response to a drive or from a desire to relate to an outer point of interest. In fact, the movements did not; they were given to the actors by the director who was taking advantage of the abstract meaning possibilities of line patterns, of balanced contrast, and of repetition, all of which are symbolic and abstract representations of an inner thematic truth, not of an inner psychological motivation.

Perhaps a pure system either of symbolic or of realistic character movement has never been employed.

---

[63]Gassner, op. cit., p. 252.

Even Jessner, who believed that the actor should be a symbol for the idea and not a person in realistic detail,[64] drew his abstractions from natural behavior. An analysis of his moves in The Weavers shows a very realistic handling of crowds and individuals, a constant flow of movement, and both an inner and an outer motivation clearly expressed.[65] Even in the highly stylized Noh Theatre of Japan, Fenollosa maintains that the actor is presenting a complete service of life; he symbolizes, or presents, a diagram of life and of recurrence in very simple situations.[66] Although the mimetic stage is despised by the Noh Theatre, nevertheless, psychological motivations seem to be at the root of each move both in the Noh and the Kabuki Theatre.

Perhaps a summary of opinion, when both the practice and the theory of various authors and directors is taken into account might be this: a wide variety of symbolic, formal, metaphorical, and psychological expression of the character's inner truth should be apparent in his outer form. It would seem that their combined advice is to seek out all varieties of inner truth about the characters and the situations; to express these truths in images, theme statements, and titles that will suggest movement patterns; and then to plot the actual movement on the stage.

---

[64]Lewis, op. cit., pp. 2-3.

[65]Cole, op. cit., p. 326.

[66]Ernest Fenollosa and Ezra Pound, NOH (London: Macmillan and Co., Ltd., 1916), p. 17.

In view of the above, it would seem that the usual distinction--between the movement that is "necessary," caused by the script, and the movement that is "arbitrary," caused by the director--becomes a rather meaningless distinction. Because of the richness of material available to the imagination of the director from the script itself, when he has the techniques of discovering and using it, the arbitrary element seems to be the placement of a dividing line between "arbitrary" and "necessary." Eliminating the distinction and using all approaches would better prepare the director to give a richly expressive movement context to the words of the playwright.

d) <u>Principles of Gross Movement</u>.--Some texts suggest that right after the director's psychological and metaphorical analysis of the play script the ground plan should be devised. Other texts suggest that the gross movement should be plotted before the ground plan.

1-Relation between Ground Plan and Gross Movement. Canfield's suggestion is to develop the ground plan with the designer before blocking is planned in detail, but after a director's script analysis so that certain general movement ideas can result.[67] This ground plan should provide acting areas and places to cross so that movement can be properly motivated. Dean tends to bring the designer in at a later time. To Dean, it seems better to devise the ground plan

---

[67]Canfield, <u>op</u>. <u>cit</u>., p. 130.

a1
sι
p
t
h
w
f
a

after the planning of the gross blocking. The reason
suggested is that the director should decide from his
play's context and his knowledge of the relationship be-
tween moves, stage areas, and script elements, what form
his blocking should take and then put in the furniture,
walls, entrances, or scenic elements in places appropriate
to the moves.[68] Other directors, wishing to take more
advantage of the designer's creative abilities, place the
responsibility with the designer for making the script
analysis concrete in the setting.

Where in the blocking process the ground plan is made,
and by whom, is dependent on the director's conception of
his own function. Certainly if the director is to take
advantage of his very complete analysis and his theories
of the meaning of areas and movements, only he can know what
resultant stage patterns will best fulfill his analysis; he
should provide the ground plan. The alternative would
seem to be to work with a designer who was also a director
and was sympathetic to the director's movement ideas. In
this latter case, two heads working with one point of view,
as completely as the director works with his actors, might
provide a jointly produced ground plan that had more move-
ment potential than the product of the single artist. Note
that in any case, there is only concern here for the best

---

[68]Dean, op. cit., p. 227.

product; this study is concerned with the best communication of ideas and feelings through movement, not with the contributions of designers or actors.

2-Relation Between the Moving and the Still Picture in Gross Blocking. In the blocking phase of the analysis procedure there seem to arise two extreme points of view, with many positions between, concerning the relationship between the still picture and the gross move. The director has to decide what kind of still picture or what kind of movement, or combination of the two, best expresses each motivational unit, or beat as a whole. Generally the two extremes are either a scene composed primarily of movement but starting and ending with a still picture, or a scene composed primarily of a still picture but starting and ending with movement. The first method pictures relationships in the scene before and after change takes place, while the second pictures a relatively static set of relationships arrived at and concluded by change.

The still picture extreme, stated by Drummond, is that action on stage is fundamentally a series of tableaux, with movement consisting largely of transitions from one tableau to the next.[69] To be sure, he suggests moving the characters one at a time and not as a group. Still, the relatively stationary picture carries most of his meaning and the move is primarily to change pictures.

---

[69]Drummond, op. cit., p. 18.

At the movement extreme are those apparently more influenced by dance than by literature. Selden perhaps is the most extreme among the theatre people who are not basically choreographers. He feels that force, the secret of unbroken movement, should be ever present on stage, sustaining a "condition of aliveness," that there should never be a complete rest.[70] However, his view does not mean he suggests constant physical movement, for he will accept the condition of preparedness to move. He suggests that movement be expressed in pulsations, that is, periodic action and periodic rest.[71] He borrows a term from music and choreography for this condition, called phrasing, a term that is developed most completely by Doris Humphries, choreographer. Generally, though, even the periodic rests of the pulsations may be marked by slowing of movement, hesitations only, rather than complete cessation of movement.

Selden feels that human beings need periodic hesitations and repose to help them comprehend what the action means; hence, phrasing, or fragmentation, is a valuable aid to understanding.[72] He maintains further that a rest, repose, gap, or pause should be used as sparingly as the pause in speech, that the simple lessening of tension may be sufficient for phrasing.[73] Thus the image of ebb and

---

l

flow becomes more illustrative of his surge and repose phrasing than does movement and still picture.[74] According to Selden the audience desires a quickening of the sense of living because the audience's ambition exceeds its energy; so audiences attend theatre at least partially to live vicariously a more active life.[75] For this reason transit, pursuit of adjustment, and covering ground, along with change of content, of interest, of pace, of shape, and of mood, are vital for keeping the audience's senses and minds alert.[76] These changes are most appropriate for a story that moves forward every minute, and for action that progresses physically as much as possible. When it cannot, it should continue to progress inwardly.[77] From what Selden, and others, have said concerning making progress outwardly apparent, it is possible to assume his advice is for a continual physical manifestation of progress.

Selden indeed asks for a continual sequence of acts of adjustment in both time and space.[78] When coupled with his view that good stage movement is essentially a dance, it would seem that continual movement, with only pace changes to provide rests, is his ideal of stage movement.[79] However, Selden doesn't seem to want to go quite this far since he also states that a design, after a series of

---

[74]Ibid., p. 195. [75]Ibid., p. 135. [76]Ibid., pp. 137-47. [77]Ibid., p. 199. [78]Ibid., p. 155. [79]Ibid., p. 279.

active moments, may come to rest with a still picture.[80]

It may be accurately noted, however, that this use of a

still picture is quite momentary and minute when compared

to his preceding active moments where meaning is expressed

in movement.

Given these extremes, the in-betweens can now be

polled. Appia seems to want almost continual movement by

actors and a still picture by the scenery. He warns that

if the play or the actors are immobilized for even one

moment, movement with its power and significance is sacri-

ficed, without receiving the least compensation.[81] His

view is that the stage does not have the painting's

possibility of presenting past, present, and future

symbolically all at once. The painting's special possibil-

ity allows it to give the impression of movement. Actual

movement of actors in time and space expresses life,[82]

while the scenery should be solidly resistant to human

movement for contrast with it.[83] Thus, the scenery

provides the compositional still picture to express the stable

theme of the play while the actors express the living,

moving qualities of the play.

Colby Lewis reveals that Jessner apparently agreed

with Appia, that a play can have still picture and motion

at the same time, with the stage setting supplying the still picture and the actors the motion.[84]

Hewitt expresses a pulsation, or alternating movement and still picture theory in embryo. He feels that suspense must find relief in action, action being change and growth that breaks loose from gradually mounting tension.[85] Yet he also espouses the idea that the actor must achieve a continually changing pattern designed to express the character and thought of the play.[86] Unfortunately he presents little concrete idea of how his continual change should be accomplished in conjunction with suspense and relief.

Hopkins would seem to approve of a flowing movement pattern of little abrupt change, of little hesitation, or even punctuation, if he be taken literally. Fluidity of movement with no disturbance is what he advises in order to lull the audience into a feeling, non-thinking unit.[87] To Hopkins fluidity is the best way to achieve a unanimous effect from a diverse audience; his is a sort of hypnotic somnolence wrought over their thinking minds. Whether or not he achieves his effect may not be, however, entirely due to the fluidity of movement. The audience's predisposition to enjoy a play, as a group, and to put aside

practical, moral, and divisive considerations may be large-
ly responsible.

Leaning more toward the still picture view of blocking,
Krows says that the play's action consists of the players
moving from one important grouping to another;[88] only the
most necessary movement about the stage should be allowed.[89]
Brown proclaims that the situations as they develop should
be illustrated by the grouping of the actors and their
body positions.[90] And although Boyd writes that stillness
is analagous to silence, and implicitly, perhaps, to be
used as sparingly as a silence,[91] he also writes that
movement to him is largely the means for obtaining fresh
groupings whose relationships tell the story of the play.[92]

Going back in time a little, Antoine insisted that
movement is the actor's most intense means of expression,
but Antoine was not too explicit about just how the actor
should use it.[93] Antoine's statement could give rise to
either of two interesting contemporary applications: if
movement is powerful, then use it constantly in order to
have a powerful play; or, if movement is powerful use it

---

[88]Krows, op. cit., p. 63.   [89]Ibid., p. 65.

[90]Brown, op. cit., p. 84.

[91]Boyd, op. cit., p. 96.   [92]Ibid., pp. 74, 76.

[93]Cole, op. cit., p. 100.

sparingly and save it for when it is most needed. Antoine
himself probably used some combination of methods since he
maintains that the statue-actor is to be decried, that the
stage needs more moving human beings,[94] and yet he writes
of the proper way of grouping the characters.[95]

The Duke of Saxe-Meiningen felt the stage should always
depict movement, but from his context it would seem that
the asymetrical, broken-up stage picture with its sug-
gestion of movement was more used than actual movement.[96]
Otto Brahm felt the chorus should not be grouped but have
free play of movement.[97] Tairov felt that choreographic
principles should be applied to a play to produce a
symphony of movement.[98] Gordon Craig felt movement was
not only important but should resemble in amount and style
the dance.[99] Belasco writes of indicating his ideas by
the groupings of the characters; he is not explicit as to
whether these groups are still or moving.[100]

This summary of earlier directors is capped with a
statement by G. B. Shaw meant to apply to dialogue rather
than motion. Shaw's admonition is never to have a moment

[94]Ibid., p. 199.   [95]Ibid., p. 194.

[96]Ibid., pp. 81, 85.   [97]Ibid., p. 104.

[98]Gassner, op. cit., p. 88.

[99]Cole, op. cit., p. 148.

[100]Ibid., p. 126.

of silence on the stage except as an intentional stage effect.[101] The statement is provocative when associated with Boyd's idea of stage silence being analagous to the stage at rest. If Shaw's statement were altered by substituting analagous parts it would read, "never have a moment of motionlessness on the stage except as an intentional stage effect." The analogy results in an interesting point of view for the proponents of theatre movement as constant flux, a view similar to the one held by Selden.

Having heard from Selden, this study now turns to the remaining principle theorists of the study: Canfield, Dean, Dietrich, Dolman, and Smith with the addition of Miner, for their opinions on the relation between still picture and movement in blocking principles.

Canfield is somewhat difficult to pin down; most of his conclusions on the relation of still pictures to movement must be drawn by inference. Characters move in order to convey their psychological relationship by their physical placement. They may begin a movement in a position to show one set of relationships and end in a position to show another.[102] He suggests that a hesitation at the beginning and end of a move will help tell the audience what the move means. For example, a character may start in a dominant position and end in a subordinate one. It

---

f
t
s
t
r
t
l
p
o
f
s

would seem that Canfield reserves no particular meaning
for the movement part of the phrase, merely a meaning to
the serial juxtaposition of still pictures. Later he
suggests that the importance of group movement is the
finding of the characters in the right place at the right
time.[103] His emphasis on the still picture and its mean-
ing seems to be further supported by his discussion about
the length of time a stage picture may be held before it
loses the audience interest.[104] The final proof of his
point of view may be in the way he expresses his notion
of blocking; he infers that good blocking consists largely
in having right positions to illustrate character relation-
ships.[105]

There is one other tendency in Canfield, however, that
may lead the reader to suppose that Canfield presupposes the
reader's knowledge of Dean. His general point of view
toward the details of movement, composition, and picturi-
zation is that Dean, or other texts, have already adequate-
ly discussed them. If the assumption is true, Canfield
does not disagree with Dean's view that picturization,
relationship, position, and moves can apply to either the

---

[103]Ibid., p. 231.

[104]Cole, op. cit., p. 167.

[105]Canfield, op. cit., p. 268.

still or the moving picture. Canfield's main positive contribution to movement meaning is his suggestion to start and end a movement phrase with a meaningful still picture, a suggestion already made by Dietrich.

Dean, as mentioned above, has suggested that the same categories that exist in the still picture can exist in the moving picture. His view seems to be that the still picture and the movement are equally important in conveying meaning. Dean states that picturization is to embody the author's concept that each moment of the play is depicted pictorially.[106] And further, when movement is put with picturization there is a picture that is ever changing.[107] Even when the overall stage picture is relatively stable, the picture does not remain static during the scene but changes slightly as the emotional reactions and relationships of the characters change.[108] He compares stage movement to the motion picture. Both are a series of static pictures which pass so quickly, one after the other, that the eye doesn't notice any break between.[109] Hence, constant small movements reflect the general progressive values in the scene.

There is an interesting difference here between Dean's and Dolman's use of the motion picture film metaphor. Dean thinks of film as a series of still pictures, each with

---

[106]Dean, op. cit., p. 207.   [107]Ibid., p. 220.

[108]Ibid., p. 22.   [109]Ibid., p. 220.

picturization value, whereas Dolman thinks of film as having a meaning in sequence but whose value as still pictures is usually slight.[110] Here seems to be a most refined point of contact between the views of movement as flow and as a sequence of still pictures. Dean is still dealing with values that are primarily inherent in still pictures; Dolman has changed his milieu to movement, and its meaning apart from what it has in common with the still picture.

It is this study's view also that the motion picture is not ideally nor really a sequence of still pictures. In practice individual frames of a motion picture film are often slightly blurred; in effect each frame carries the sequence between itself and the picture preceding and following, belying the concept of a series of still pictures. On the other hand, the cartoon, which usually is actually a series of still pictures, has a jerky quality when projected because a series of still pictures simply is not the same as a flow of movement. Aside from the problem of the metaphor, it still seems that certain filmic movements, caught at some instant, are undecipherable. Neither direction nor purpose is clear. As Dolman concludes, that is why movie "stills" are usually separate posed shots, arranged in Appia's painting method of implied motion, and not actually reproduced from a segment of film.

---

[110]Dolman, op. cit., p. 116.

Dean seems to conclude, however, with a view fairly balanced between the two extremes. Movement exists in the transitions from one to another still picturization; however, the movement between the pictures is just as important as the pictures themselves.[111]

Dietrich states that one of the primary purposes of movement is to dissolve one picture in order to form another.[112] This process of dissolving and reforming is called movement. In the process of dissolving and reforming, meaningful pictures can be held from approximately a second to over a minute and still hold audience attention and carry a meaningful relationship to the verbal context.[113] Dietrich also makes a point similar to that of Canfield, and prior to Canfield, that a motivation unit can open by showing the starting relationships of characters, and can close with a foreshadowing picture.[114] Dietrich's point gives a needed dimension to Canfield's suggestion by showing how a closing picture may lead into the next phase, or motivational unit.

Dietrich elaborates on pictorial continuity by suggesting that each picture should relate to the preceding and following ones.[115] His tendency, on the whole, seems to be to consider movement, in its gross manifestation, to

[111]Dean, op. cit., pp. 243, 245.

[112]Dietrich, op. cit., p. 91.   [113]Ibid., p. 91.

[114]Ibid., p. 85.   [115]Ibid., p. 98.

be primarily a connecting link between meaningful still pictures. Later, as will be discussed, Dietrich does present movement in a context where it has meaning, but the meaning is largely psychological; i.e., concerning the motivation one character may have toward or away from a point of interest; the meaning of gross blocking elements, the usual relationships that pertain in the still picture, do not seem to be presented as having a counterpart in meaningful moving elements, except in terms of psychological motivation. Perhaps, however, the lack is only partial; his previously referred to discussions of serial and circular responses, as well as points of interest, do suggest movements that have more meaning than the mere dissolve from one still picture to another. Perhaps the real lack is that Dietrich does not seem to have any discussion of the meaning of abstract elements of design, his view being that almost all meaning is dependent upon a psychological context. The idea that shapes or patterns may have meaning all their own, derived from previous experience by association, is not discussed.

Miner, in his chapter in Gassner's anthology, suggests a relationship that sounds very poetic but is not too clear in its practical application. It goes something like this: An actor should never be still without creating the impression of a capacity to move, nor move without creating the impression of a capacity to stop.[116] He further states

---

[116]Gassner, op. cit., p. 255.

that movement is merely the interval between moments of
stillness, and stillness is merely the generation of an
impulse to move; further, a common failing of the director
is to conceive of a movement as an actionary interval
between static states.[117] In clarification, he states that
a director must know the subject of design but never use
design in its frozen, or static, state; that the director's
pictures must be kept fluid;[118] and that Miner prefers, in
general, schemes of movement to methods of grouping actors
in relation to each other.[119] He feels that the essence of
movement is vibration; hence, though movement must be main-
tained at all times, the movement may, at certain times,
consist of excitement within the mind which can be as
vibrant and arresting as a door slam or a scream. In
essence, let the actor's mind dance and his feet may rest.[120]
To further clarify, or confuse, the issue Miner proclaims
that movement is a cathode-annode oscillation between
character and plot.[121]

Just when it seems that Miner's meaning is clear
something throws doubt on the clarity. His notion of the
capacity to move and to stop sounds more like a poetic
parallel statement than a helpful suggestion; but he may
only mean to suggest a principle of continuity in movement;

---

[117]Ibid., p. 256.

[118]Ibid., p. 258.

[119]Ibid., p. 259.

[120]Ibid., p. 276.

[121]Ibid., p. 254.

each movement or still picture contains actors who have potential for change. His use of "vibration" may be similar to Selden's "sense of life," in that a certain "elan vitale" should never be missing from the actor. If this is all, then the reader must hold Miner's use of the word "movement" suspect. When he says "movement" he may only mean a sense of aliveness. In which case "movement" is being used two ways: as appearance of "life force" and as physical changing of position.

Perhaps Miner is really only advocating the continual impression of life rather than constant movement when he uses such expressions as keeping the pictures "fluid," or "schemes of movement" as opposed to "grouping." Certainly he seems to be condemning the "dissolve" idea of movement, as suggested by Dietrich and others, when he proclaims that it is an error to think of movement as an actionary interval between static states. If Miner's cathode-annode oscillation refers to the vibration of alternating current, then his metaphor is not clear to this study, but not beyond the interest of this study, for it is a metaphor which may well be useful to some director.

Most of Smith's views have already been expressed by others in the above discussions. Suffice it to remind the reader here of Smith's notion of the meaning of symbolic movement: a series of changing relationships carries the meaning of the blocking. But also, Smith says, the

director must give his series of pleasing pictures dramatic meaning.[122] Smith asks for a definite pattern of movements to make a series of well composed pictures, each of which has meaning in terms of the scene.[123] Smith also refers to the series of pictures as flowing naturally from one into another.[124] Exactly what "naturally" means is not clear; it could be in the sense either of illusionistically, that is, drawn from life as in mimetic movement, or of logically, that is, having understandable symbolic meaning or sequence as in metaphoric or symbolic movement, or Smith could mean "naturally" in both senses. The point is, that Smith would seem to agree primarily with Dean in the view that both movement and picture can be important in the conveying of meaning.

It appears that there are three tendencies in the authors' views about what kind of movement best interprets a script. Either movement is conceived of as a series of still pictures, each of which is held for some duration to express the meaning of a particular moment in the play, or conceived of as a continual flux, pulsating or vibrating, reflecting the constant inner and outer movement of human beings; or, of course, as some combination of these two. Perhaps the majority approve at least of the impression of

---

[122]Smith, op. cit., p. 101.

[123]Ibid., p. 105.   [124]Ibid., p. 98.

continual life, a life that is communicated by movement that reflects both inner and outer truths. Dean's concept seems to be closest to the working midpoint; the constant movement of the script is paralleled by constant movement by actors, but the latter does not entail constant shifts in basic blocking positions; major shifts in position would be saved for major changes in idea; motivation, action, or French scene.

C. Preparation for Blocking Completed

The director is now ready to apply the principles of movement in context directly to his particular script. After making some basic decisions about how much pre-planning to do, how much thematic and how much psychological analysis to make, what abstract line and form are appropriate, what kinds of units to break his script into, what kinds of images to use, how much rest and how much motion will be pertinent, he is ready to get specific. If he wishes to take advantage of the power available to him in the meaning of movement, he will be looking to his script for opportunities to interpret it through abstraction, mimesis, metaphor, and symbol in motion. If he wishes to prepare actors to do their best in interpreting his movement script he will also be translating his analysis into motivations for moving characters.

CHAPTER IV

PLOTTING THE MOVEMENT IN THE CONTEXT OF THE PLAY

A. Introduction: General Application of Blocking
Theory and Script Analysis to Plotting

When the director has made the basic decisions about
the use of motion and still picture, of phrasing and pul-
sation, and of the individual and progressive use of stage
areas, all based on a script analysis of theme and
motivational units that yield moving abstractions, meta-
phors, and symbols, he is ready to combine his analysis
with his blocking theory in the specific plotting of move-
ment for his script. The order of procedure he follows in
plotting will provide the order of this chapter.

1. Blocking Order: From Gross to Fine to Refined

Dean, and almost all the authors, suggests starting
with the larger abstract patterns and working down to the
smaller group movements, then to the many relationships
between actors in any particular scene, and finally to the
more refined movement of pantomime or business. In this
order, going from greater to lesser, the first step seems
to be to start either by selecting basic stage areas in
which each scene will occur, by plotting basic positions
for key climax scenes, or by plotting the movement pattern

150

of key climax scenes.

2. Order Dependent Upon Principles Employed

The order and method the director employs in plotting will vary somewhat according to what blocking principles he chooses. The first determinants will be his choices among three ways of viewing the script: First, motivationally, as a progression of psychological interrelationships, or second, symbolically, as a progression of metaphors, or third, aesthetically, as a progression of abstract elements that reflect certain qualities within the play.

Once he has decided how to view the script his method will be further modified by his choices among three sets of variables: First, according to whether the director is using as his basic analytical unit a French scene, a motivational unit, or a thematic unit, or second, according to whether he is preparing to devise basically a series of pictures or a sequence of movements, or third, whether he is thinking of a series of scenes localized in smaller areas of the stage, each with its inherent movement pattern, or a sequence of scenes each using the entire stage but each with its particular degree of movement and hesitation and quality.

To some extent his choice of style will also enter into his blocking scheme, though at the plotting phase the way in which moves are made is not so important as the where and the when.

B. Matching Gross Movement to Script Analysis

The principles of script analysis and gross movement
have been discussed. Now the specific plans for plotting
the blocking, as suggested by the authors studied, will be
presented.

1. Selecting Stage Areas to Match Meaning of French Scenes

At this stage in planning Canfield assigns each French
scene to an acting area in his ground plan; however, Can-
field does not overlook the fact that some scenes will need
to use the entire stage.[1] Canfield's ground plan, then,
would be ideally a complex of smaller stage plans (acting
areas) that together make up a unified setting. In effect,
the setting would correspond in its parts and in its whole
to the script's French scenes and total play. Note that
Canfield seems to favor the still picture view in writing
of an area appropriate to a scene rather than of a move-
ment pattern appropriate to a scene.

a) Mood, Theme, and Key as Determinants of Area.--Dean
suggests matching up the scene with the acting area whose
mood quality best depicts that scene. Since Dean feels
that each area not only has its own value of strength
and weakness but also a definite feeling, or mood, value,
he naturally feels that each scene will convey its mood

---

[1]Canfield, op. cit., p. 130.

more convincingly if it is played in its corresponding area.[2] However, Dean makes the point that he does not consider these area meanings to be rigid principles, only guides.[3]

Dean says the director may also decide scene by scene what geographical location, climate, or emotional relationships may help to characterize the mood or atmosphere of the scene.[4] To be sure, such a mood or atmosphere will help the director to choose the qualities of moves and business of a scene, but the mood will also help to choose the area in proper sequence and strength.

Brown concurs with those who feel that the director should make strong and weak scenes correspond to the strong and weak areas.[5] He adds an element, however, that may be useful: a positive principle for repeating areas. In essence, the director uses the same area for portrayal of the same dramatic value; the director may, in effect, reserve certain areas for certain characters and ideas.[6] Thus the director may establish by association a more specific meaning for an area than can be had merely by matching a scene with an area that may or may not inherently express the mood.

---

[2]Dean, op. cit., p. 211.   [3]Ibid., p. 212.

[4]Ibid., p. 297.

[5]Brown, op. cit., p. 11.

[6]Ibid., pp. 14, 15.

Dietrich introduces the idea of the "key" of a scene. The degree of emotional tension, or key, of each motivational unit ought to be taken into account to decide which playing area or which kind of movement pattern is appropriate to the scene.[7] Dietrich characterizes key as the combination of a drive with the degree of frustration of that drive. A strong drive with no opposition will not result in tensions of any great magnitude. In effect, it would seem that the key of a scene is roughly at the level of the weakest of the two elements, drive and opposition. The key may help the director in choosing his sequence of stage areas in terms of strength to weakness, or high to low key.

2. Selecting a Sequence of Stage Areas and Reasons for Choice

Selecting areas for individual scenes concerns matching the moods of scenes with the meaning and strength of playing areas, but the selection of a sequence of areas involves creating a sequence of scenic meanings and actions that will build to a climax. Hence, the director really has two potentially conflicting principles for the selection of area sequences. The first is to choose scene by scene according to the area that best expresses the mood of that scene; the second is to choose in some sort of

---

[7]Dietrich, op. cit., p. 165.

ascending order of strength to insure that stronger scenes
will follow weaker ones in stage area. In practice, the
smaller climaxes of the play, that diminish and build into
larger climaxes, will usually present a wave-like pro-
gression of scenes, sequences of builds, that may or may
not fit into meaningful area sequences by both methods of
placement. If not, the director must choose which is more
important when a discrepancy appears, area to establish a
scene's mood or sequence of areas to establish a build.

To complicate the selection, Dean suggests the use of
more than one stage area for each scene. To create a build
within a scene the actors can move in a progression of
areas from weaker to stronger.[8] To preserve a sequence of
scenes that will still build to a climax Dean suggests a
principle of conservation of movement.[9] The principle
refers to saving the larger and faster movement for the
climaxes so it will have its greater impact then; not to
waste it on quieter, or less important scenes.

The director has a choice here of Dean's combination,
the use of several stage areas for each scene and the
provision of build through the conservation of motion, or
Canfield's combination, the use of one area for each scene
and the provision of build through the conservation of area,
so that a strong area, or a special mood area, will not

---

[8]Dean, op. cit., p. 246.   [9]Ibid., p. 247.

have been "worn out" when the scene best played there comes
along. Canfield says on this point that as long as the
area has not been overused it is usable.[10] Just how the
decision of "overuse" is arrived at is not made explicit.

Selden seems to take a view that is more extreme than
Dean's; he states that every part of the stage should be
used at least once before the scene is over.[11] The
observation is somewhat of a jolt to the reader after con-
sidering principles of saving areas, of selecting a specific
area for a specific scene, and of progressing from area to
area as the scenes progress in strength or mood. In his
context Selden's advice does not seem to be capable of
harmonizing with Dean and Canfield. The only sympathetic
treatment of Selden's advice at this point that seems
possible is to suggest that Selden may be referring to a
scene larger than a French scene whose duration may be only
for a minute or less. If Selden refers to a larger unit,
a scene or act division between the drawing of curtains,
then there may be some wisdom to the suggestion. It would
mean that within the entire scene or act the director
avails himself of the maximum contrast and change possible.
However, to harmonize Selden's advice with that of Dean
and Canfield, this study would have to state that every
area should be used at least once during the entire play,

---

[10]Canfield, op. cit., p. 136.

[11]Selden, op. cit., p. 5.

or perhaps entire act or scene, but not during each
motivational unit. Even then, such advice might not be
appropriate for certain presentational forms of theatre
that may only use the down stage playing areas.

3. Relating Necessary Movement to Invented Movement in Plotting

Once the scenes have been at least tentatively matched
to stage areas in some sequence that provides for meaning
and build, the director must decide how much movement he is
willing to invent both within and between scenes, if nothing
else to get his actors into different relationships to each
other and into different stage areas.

Dolman opens the door to an interesting principle of how
much the director may invent when he suggests that the
purposes of movement need be no more than associated, or at
least consistent, with the main purpose of the scene and of
the play.[12] Most other authors write in terms of matching
a picture and a movement to a script as exactly as possible.
However, if the director accepts the role of author of the
movement then he may wish to be more inventive. Dolman
seems to provide a bridge between the language purist who,
like the aforementioned Gielgud, feels movement should be
kept at a minimum so as not to get in the way of the words,
and more creative directors, such as Tyrone Guthrie, who

---

[12]Dolman, op. cit., p. 113.

are often accused of being too inventive in blocking.

A director will certainly have to invent a great deal of movement if he chooses to follow Dean's suggestions for the requirements of a dramatic build. Dean suggests that to build the play the director may increase the length of movement, increase the number of people moving, contrast the direction of movement, increase the tension of movement, increase the numbers of crosses, increase the amount of small movement (business), and also use shorter movement.[13] Although Dean is speaking primarily of building individual scenes, the principles may well be applied to the entire play as the macrocosm, with the French scene as the microcosm. A scene may be characterized, along with its title, as one of short, medium or long moves, or as a scene of one, a few, or many people moving. Thus building from one scene to the next provides an overall build to the play, not merely a series of smaller builds in each scene. Of course, within each scene, even though characterized as, e.g., a scene of groups in movement, the size of the group, or the speed of movement, may increase during the course of the scene. To implement these suggestions would seem to require much movement invention.

Dolman provides a principle for the extremes of movement invention possible in the play. The minimum of movement is that which is absolutely necessary to get actors on

---

[13]Dean, op. cit., p. 246.

and off stage; the maximum would seem to be that which is at least consistent with the play. The latter would allow for any mimetic, metaphoric, or symbolic invented movement that either supported or contrasted with the script words as long as the audience saw or felt no inconsistency between the words and the movement. The audience is mentioned here as judge of the extremes because another director, with his own preconceptions of what best interprets a script, might well see an inconsistency that the audience, prime goal of the play, might not.

4. Choosing a Scheme for Relating Moving and Still Pictures to the Scene

In effect, there are at least three possible conceptions of the sequence of scene units; the resolution may well depend upon the play that is being analyzed, but the director may never see the possibilities for alternates unless they are first understood and hence looked for. The first is the view that each unit, or scene, is a still picture broken and changed by movement to a new still picture; the change of subject is the transition and carries the movement. The meaningful, time consuming, scene is enacted during the relatively still picture.

The second is the view that each scene is the movement pattern, the working out of some imbalance, where the basic meaning of the scene is expressed by movement; the beginning and end of each scene consists of a still picture, a rest;

the rest is the summation of the previous scene and the transition between scenes.

The third is the view that the scenes should alternate, first a movement scene and then a still picture scene, in effect, a wave theory. The fluctuations between moving scenes and static scenes would give relatively equal weight to each in alternation. Again it becomes even more obvious that the director will have to make his decisions in conjunction with a script; however, at least he should realize that the still picture is not the only major method of portraying relationships in scenes.

a) Changing the Scene by Movement.--Boyd suggests movement at each new thought, thus providing the means of changing the stage picture.[14] His suggestion fits the general formula of a phrasing or motivational unit that would consist of the picture expressing the basic meaning of the play with movement between pictures. Although he states there ought to be an observable reason for the move itself, he is basically less concerned with motivated movement than with expressive pictures.

b) Interpreting the Scene by Movement.--Selden is inclined to feel that the main content of the scene should be interpreted by movement and the change should be made with a hesitation, since the greatest flow brings the

---

[14]Boyd, op. cit., p. 87.

greatest excitement.[15] In his context Selden is equating greatest flow with greatest appearance of life. In general his image might be a stream at spring flood. It would seem, however, that the idea of flow needs modifying. An even flow, no matter how great, may give a sense of life without a sense of excitement. His own principles of rhythm, pulsation, and tempo need inclusion. In fact, tying "flow" to "excitement" might be misleading; for the Kabuki "mie," or "pose," that embodies the emotions and meanings of the scene that precedes it, can be very exciting, as can any motionlessness that is tense with potential.

Indeed, the degree of flow may increase excitement, but the felt flow is perhaps the important ingredient. The felt tensions, felt speed, felt barriers to movement overcome, the felt mass, or the felt contrast with lesser flow may be of as much, or of greater, importance than the actual flow. However, in agreement, the degree of actual flow is one important element in gauging the degree of excitement in movement patterns as they are matched to the motivational units.

c) Alternating Hesitation and Movement.--Movement and hesitation can both be exciting, in alternation, if the director bears in mind Dietrich's observation. He points out that movement is always the resolution of tension.[16]

---

[15]Selden, op. cit., p. 197.

[16]Dietrich, op. cit., p. 122.

If scenes of tense hesitation alternate with scenes of movement that resolve the preceding tensions, and perhaps set up additional tensions, then excitement can be maintained without a constant flow of movement.

It seems to this study that a similar exciting alternation of scenes would emerge from considering movement as the restoring of balance to an unbalanced situation. In a balanced situation, as Dietrich points out, there may occur an impulse within the script lines.[17] This impulse, which could also be the entrance of a new character, could throw the situation out of apparent balance. A script line could set up a force that would create imbalance; the entering character could set up either an apparent physical imbalance or an imbalance of forces depending upon his connotation in the scene. The apparent imbalance of either force or mass can result in the plotting of movement aimed at restoring the balance.

The problem for a continuing alternation theory would be how to restore balance, or resolve tension, in such a way that the final restoration or resolution of each wave was not static, such that it contained potential for future movement. Of course the introduction of a new mass, or character, or of a new idea, or script line, can upset the balance or create new tension. The alternative, for movement, would be to maintain some degree of tension or imbalance even

---

[17]Ibid., p. 122.

in the restored or resolved, relatively unmoving, scene.

Now the director needs some guiding principles to help him match pictures and movement to already determined French scenes. One such principle might be this: if an impulse to move comes at the conclusion of a French scene, or motivational unit, then the movement may be useful to change the picture to a new physical (and psychical) relationship. If the impulse comes at the beginning of a French scene then it may provide the imbalance to create a movement pattern throughout the scene, a pattern started and ended with a balance-in-tension picture that portrays the starting and ending relationship of the movement, a picture that carries continuity from the old scene and foreshadowing for the new one.

5. Selecting Movement and Area to Satisfy Both Thematic and Psychological Demands

At this point in his blocking, the director should make sure that his movement within the scene, and between scenes, portrays the larger thematic and mood meanings of the play. Each area, sequence of areas, and formal move should fit the thematic intent both of the play and of the scenes within the play. Perhaps simultaneously he must see if latent in every move is also a psychological motivation he can suggest to his actor. In other words, the large form must be a good framework for the smaller details to come. Of course, if the play is being performed in expressionistic

style or modern dance style the general progression of stage areas and larger action relationships may be sufficient motivation for movement; however, if the play is at all realistic, each move must lend itself to psychological motivation as well as to thematic purposes. As Dietrich suggests, even though a particular movement is primarily to achieve a new position on stage, the movement still needs psychological motivation.[18]

6. Summary: Checking the Gross Plotting Against the Script Analysis and Principles of Blocking

Before concluding his plotting of a sequence of areas and of the relation of move to still picture in the sequence, the director should check his plotting with certain blocking principles. He should see if he has made maximum use of the potential of each area, of the power of changing areas, of the establishment, by repetition, of a meaning for each area, and of the surprise inherent in using an area for the first time. He should also check to see if he has been consistent in the assigning of strength, weakness, and meaning to each kind of area and move. For an audience may well accept a play using almost any concept of meaning as long as that play is internally consistent in the use of its own concept.

Up to this point in the plotting of gross movement the director has still been dealing largely with elements that

---

[18]Ibid., p. 140.

give him degrees of strength and weakness, elements of emphasis. He needs more of the play's context and more details of character relationships to be more specific in his meaning. Next, therefore, within his gross blocking scheme, he may refine his picture and moves to include the psychical and physical relationships of actor to actor on the stage, with its related problem of actor to audience relationship.

C. Matching Gross Movement to Analysis
of Character Relationships

This action is concerned with the plotting of gross movement relationships between actors and between the actors and the audience within and between the scenes already plotted into the gross blocking pattern.

1. Introduction: Possible Actor to Actor and Actor to Audience Relationships

The first actor to actor movement, and resultant relationship, advocated by all the authors who speak on the subject, is the retreat and advance. Variations on the move are the cross and the punch which combine an advance with a retreat. Second, less described, but still fairly frequently mentioned, is the rise and fall, or the elevation and descent. The first pattern concerns horizontal relationships and the second pattern vertical relationships. Variations in these relationships are made with different line patterns

and with variations in speed of movement. Specificity is
added with the direction the body is facing and with body
posture. Once these basic actor relationships and their
variations (including the starting or resultant positions of
close or distant, higher or lower) are considered, the
director then can think of those same relationships between
actor and audience. The actor can advance or retreat, rise
or fall, in relationship to the audience, or he may make a
lateral movement which may approximate a cross, or combin-
ation of advance and retreat, all in relationship to the
audience, or down center area.

2. Plotting the Oppositions: Approach-Retreat, Rise-Fall.

Since these four general types of character relation-
ship are the most common they shall be polled first.
Dietrich's treatment of these variables appears to be the
most comprehensive. His starting point is the need for
motivation, the necessity for seeing a reason for an action.[19]
As has been seen this means to Dietrich, in part, an approach
to, or a withdrawal from, a point of interest.[20] He has
charted various varieties of straight line moves an actor
may make in relation to this point of interest and has
suggested possible contextual meanings for these moves. In
general, the move toward is made on positive script lines

---

[19] Ibid., p. 9.

[20] Ibid., p. 124.

and the move away is made on weak script lines.[21] There are

of course many nuances; the situation of fear may call for a

retreat, but also the situation of disdain; the attitude of

love may call for an approach but so may the attitude of

aggression, or hate. A cross may show indifference, or it

may show an attempt to gain attention from the person who is

the point of interest. Be it first observed, however, that

all of these moves do require a point of interest, a point

that is usually, though not always, a character, in relation

to which the movement is made.

Dietrich adds another dimension to the opposition; he

writes of strong and weak moves. His central point concerns

the strength of tension and the weakness of relaxation in

moves, that tension is a sign of emotion.[22]

Another aspect of the oppositions is the pictorial

result of the approach and retreat, or what Dietrich calls

the "grouping by friends".[23] When characters approach those

they like, and retreat from those they dislike, the result

will be, of course, this grouping. These are character-

istics described by Smith previously as the metaphors of

opposition and siding.

It should be noted that there are two distinct

elements: the process of siding and the pictorical result

of siding. It is the contention of several, including

---

[21]Ibid., p. 125   [22]Ibid., p. 126.

[23]Ibid., p. 112.

Dolman previously cited, that the still picture may not be clear unless the dynamic process of arriving at it is also clear. Without the whole movement for reference, an actor could be walking toward or backing away from an object of interest.

There is also the problem of determining, without words, whether the approach is really a siding with or an opposition to an object. Tension alone cannot convey the difference, as Dietrich points out, because it could be the tension of hate, of love, or of any other emotion.

Dietrich does suggest ways of making the various parties to the position, or the move, dominant or subordinate, e.g., by difference in level, centrality, focus, and contrast,[24] but these are merely compositional emphases, not meanings. They succeed in attracting audience attention with varying degrees of strength but not in saying anything about the point of interest or the elements causing the emphasis.

Canfield suggests additional oppositions in movement to reflect the progress of struggle between two characters; in general his idea involves first an inclination to move and to group right, followed by the same tendency to the left.[25] Such change will help to indicate the changing tide of battle. His idea may stimulate thinking along

---

[24]Ibid., p. 110.

[25]Canfield, op. cit., p. 164.

Smith's line of punch and retreat. In effect, Canfield seems to be finding physical moves to express a sequence of attacks by one party that involve a retreat by the other party, then a sequence that reverses the trend.

Canfield also talks of the retreat and advance combination in terms of apart and together, or isolation and grouping.[26] Again the director may choose; if he thinks of "isolation" he tends to block the relationship as a still picture; if he thinks of "isolating," he tends to block a moving process. The balance between the approaches would be to depict togetherness, then to move the scene in a process of isolating, and then to complete the process with a fairly static grouping depicting isolation.

Dean speaks of retreat and advance with the variations of starting weak and ending strong, or the other way around.[27] The result of these variations would be to show an alteration in motivation during the course of the move. A similar technique would be to end higher or lower than the starting point to show weakened or strengthened resolve.[28] Again the meanings would seem to accrue from two general sources: the higher-lower relationship seems to have both a metaphorical significance and a suggestion of relative physical strength; a change in these physical relationships

---

[26]Ibid., p. 202.

[27]Dean, op. cit., p. 224.   [28]Ibid.

would tend to suggest a change, by association, in the attitude, or resolve, of the movers.

In changing speeds another change in resolve occurs. Perhaps the faster movement indicates a greater tension, hence emotion, hence stronger purpose; at the point of change the purpose varies in tension along with the movement. Perhaps, however, there is not a variance in the amount, but in the balance, of tension. The strong, fast movement, that is in tension, shows an imbalance seeking balance. The redress is supposedly to occur at the point of interest being approached. However, part way there the movement slows; or, as Dietrich points out, the movement perhaps changes direction, an even stronger indication of altered motivation.[29]

The change in speed or direction may be indicative of a new force opposing the first force. Conflicting motives result in a near balance and slow the movement down. At any rate, change in speed, as Dean points out, and changes in direction, as Dietrich points out, can both indicate changes in motivation. Such changes seem to be based on psychological reality but may also be drawn from a physics metaphor or from the emphasis principle that change draws attention.

The only oppositions in movement Boyd mentions are attraction and repulsion;[30] Craig only asserts the faith,

---

[29]Dietrich, op. cit., p. 130.   [30]Boyd, op. cit., p. 89.

without saying how, that body movement can denote the re-
lationship between characters and their internal thoughts.[31]
He adds a warning to be sparse so as to stimulate the
imagination; sparse how or with what is not clarified.
Purdom proclaims that movements are subject to the control
of a center of interest, but he does not provide details as
Dietrich does;[32] Fernald goes so far as to say there is a
type of movement that may possess no dramatic value whatso-
ever; hence the director is entitled to use as many of this
type as he can get away with.[33] Evidently these moves are
simply to keep the scene active in order to provide motor
responses in the audience. That such motor responses will
be specific and perhaps provide specific desired or undesired
psychological meaning for a context does not seem to occur to
Fernald.

Jessner does not provide his readers with meanings for
his opposition movements beyond suggesting that height is
soaring and depth is defeat, along with his faith that move-
ment is directly expressive of feelings.[34]

Selden takes the same basic opposition movements ex-
pressed above and makes them typical of all man's motives.

---

[31]Cole, op. cit., p. 176.

[32]Purdom, op. cit., p. 79.

[33]John Fernald, The Play Produced (London: H.F.W.
Deane & Sons, n.d.), p. 47.

[34]Lewis, op. cit., p. 203.

Life for man, he writes, is an alternation of aversions and attraction;[35] and the aversions and attractions may be signified by certain kinds of moves that derive from biology and are modified by society. Gravity pulls man down and he exerts himself against it to go up; man moves toward the pleasant and away from the unpleasant; man moves to nurture or to destroy.[36] Upon these basic moves society has placed restraints and inhibitions; hence these moves are rarely seen in full force in a life situation, but the audience must see these moves large enough to know what is going on underneath the restraint.[37]

Selden's two pairs of opposition movements are, first, a lifting, or overcoming, and a lowering, or giving up; and, second, an approaching, either as an embracing or as a destroying, and a retreating, or avoiding (or, ones Selden doesn't mention, a fearing or respecting).

The problem still remains for this study to discover if there is any way to identify which of Selden's several meanings a particular approach or retreat has without resorting to the play context. Identifying specific meanings is complicated still further by the vertical moves. A forced lying down of a character in sickness and death is not the same as a voluntary lowering of a body to give aid

---

[35]Selden, op. cit., p. 162.

[36]Ibid., p. 62.   [37]Ibid., p. 69.

or comfort to someone who has fallen; yet Selden makes no
distinction. The meanings of the four moves seem to depend
on what occurrence in life the audience chooses for its
metaphor, aided by what details are given in the context.
Selden's oversimplification seems to spring from a too pat
categorizing into dialectical oppositions. Certain plays
may lend themselves to such interpretation; but life, for
many people, isn't simply dialectical.

The difficulties in interpreting the opposites of
approach and withdrawal without a context are inadvertently
illustrated by Dean and Selden. Dean maintains that move-
ment from a distance to close together will depict a move
from low key to high climax.[38] Selden maintains that en-
larging the space between characters enlarges the conflict.[39]
It would seem that an enlarged conflict could constitute to
Selden a climax in the sense that Dean uses the word.
Selden further complicates his own observation by stating
that a dislike involves a retreat, but that an approach
could be either a liking or an intent to destroy.[40] If the
latter is true, then a wider separation on stage would not
seem to enlarge the conflict in any very meaningful way
except to enlarge the area used for the conflict.

It would seem that both Dean and Selden are merely
expecting too much of abstract position as it tells about

---

[38]Dean, op. cit., p. 244.

[39]Selden, op. cit., p. 251.   [40]Ibid., p. 183.

character relationship. More of the situation is needed, expressed both in body and in speech, before any of these metaphors can make any meaning more specific. Dean seems to provide some of this material in his discussion of body position. For instance, body weight balanced back or forward may show aggression or weakness, positive or negative emotions; sitting may show weakness both physically and pictorially.[41] However, here are body positions that still go no further than the basic attack and retreat or raise and lower oppositions.

Must the director now use words to clarify the possible ambiguities in the opposition meanings mentioned above? Hopefully not yet. Dimensions of posture and facing, mixed with changes of pace, can bring him closer to specific meaning before the final refinement, the script line, is needed.

3. Plotting the Direction the Actor Faces

Besides mere abstract emphasis, then, what impression does the audience get from full face, three-quarter face, profile, and back? What facings convey what moods, emotions, or attitudes? Are these culturally learned symbols, or are they rooted in psychology? Or are they both? If there are any significant, generally communicated, meanings to facings they must have some general psychological or symbolic meaning as well as a unique meaning given to them by a specific

---

[41]Dean, op. cit., p. 224.

character in a specific play context. If there are facing
relationships that convey emotion or clarify meaning, then
they may be used regardless of the character using them.
They may be specifically shaped according to the exact
character and situation, but their general shape can convey
general characteristics. Just as tension alone does not
identify an emotion, still without the appearance of tension
the audience will not believe that an emotion exists. So
body relationships of facings may help to indicate to the
audience a thematic or basic psychological relationship
without in any way hindering the details of body posture or
characterization that the director and actor may create
together. To put it another way, facings, indicating basic
emphasis, symbol, and psychological relationship need to be
plotted prior to the details of character pantomime, or fine
movement, as facings help to set up basic gross blocking
relationships.

Previously in this study facings have been discussed
primarily in their role of emphasis; an actor may draw
attention to a point of interest by facing it, or he may
draw attention to himself, and make himself stronger, to
the extent that his face is seen by the audience; however,
Selden's is the only directing text in this study to mention
what facings may mean. For most directions of facing he
only suggests amounts of emphasis or strength, but for more
specific meaning he suggests that the straight on face is

dramatic and frank.[42] The frank facing emotionally involves the person faced; and either he is held by the direct gaze or he must compel himself to turn away. In effect a frank gaze forces an actor to become involved. Selden elaborates by suggesting that the body should always face in the same direction as the eyes.[43] However, certain problems may arise. First, if the actor's eyes always face where his head and body face the actor is always portraying a "frank" character; the script may not call for a frank character. Second, the accepted custom of "cheating" on stage is arbitrarily eliminated if a body cannot face more downstage than the eyes; the director would have to lose the advantage of impressing the audience for the advantage of some notion of realism.

Another aspect of direct facing that Selden suggests is that the play jumps out of the frame of the proscenium if an actor faces directly down stage.[44] Selden infers that an audience cannot be thus involved with a character without losing its role as audience. He does not elaborate further; however, it does seem that Selden's discussion only fits a contemporary, turned-in approach to realistic staging; in other words, although Selden doesn't so state, his suggestion seems to pertain to only one style of play. To eliminate the down stage glance is certainly to eliminate the aside, the

---

[42]Selden, op. cit., p. 210.

[43]Ibid., p. 26.   [44]Ibid., p. 215.

presentational style, and also the strongest face and body position for any style. Of course if arena theatre be included as a style, all meanings of facing, as well as of stage areas, need complete reexamination. The following analogy may provide a bridge between Selden's suggestions and other movement styles.

Selden's observations about direct facing of an actor to another actor and of an actor to the audience give rise to an analogical conjecture by this study, a conjecture not discussed by Selden. It may be that the same qualities of frank meaning that are conveyed in actor to actor facings may also be conveyed in actor to audience facings; that the more directly an actor faces his partner the more frank he is; the less directly he faces his partner, the less frank he is to his partner. Analogically, possibly the more directly the actor faces the audience, the more frank the audience feels the actor is with the audience.

Such a facing could fit into any style; the most direct application would be in presentational theatre where the audience is being directly addressed and in effect takes the place of the actor's partner on stage; but even in realistic theatre the actor can be blocked to face, and almost to face, an audience without addressing, or even seeming to be aware of, the audience; in such situations possibly the degrees of facing the audience could convey degrees of frankness with the audience.

Similarly, it may also be that the same qualities of strength conveyed by degrees of actor to audience facing may be conveyed by degrees of actor to actor facing; that the audience would interpret the direct actor to actor facing as one actor making a strong impression upon his partner, based on projecting into the play the feeling of strength the audience felt when the actor was facing the audience. In support of this view, it would seem that the strengthening of an actor, as he turns more face toward the audience, is predicated upon the two assumptions: that the actor's face is potentially more expressive than any other part of his body and that a direct face concentrates the actor's attention on the audience and hence the audience's attention on him. If the assumptions are true, then an actor to actor relationship may share these emphasis qualities. The degree to which one actor faces another may determine the audience's interpretation of the strength of impression that the actor is making upon his partner on stage. Further, if there are other nuances to meanings of an actor facing an audience, the nuances may also be true of the facing of one actor by another. Similarly, if there are nuances of meaning to the degrees of facing between characters, these nuances may also hold true when translated into degrees of facing the audience.

In effect, an audience identification relationship is suggested by the above analogy, a relationship that may have

important implications for arena as well as proscenium movement. The member of the audience seems to feel a character is frank when he faces his stage partner directly. The audience member seems to put himself into the place of the partner being faced. Realizing that a direct feeling would give him the impression of frankness, the audience member assumes a frank relationship exists between the characters. Further, if the audience member identifies with the partner, the audience member may feel vicariously the frankness, or whatever else is being conveyed, of the direct character. The audience member may feel vicariously almost as much frankness, or other, as if the direct character were facing the audience member himself.

If audience identification will allow for such vicarious feelings then a facing can have a double significance and potential for strength based, first, on the degree to which an actor's face is toward the audience and, second, on the degree to which the actor's face is toward a character with whom the audience is identifying. Suffice it to point out here that arena theatre may have to depend almost entirely upon the facing relationships between actor and actor and depend, for the meanings of the degrees of direct or indirect facing, almost entirely on the audience's ability to identify with the actor faced, or at least on their ability to draw an analogy between the way they would feel and the way the character must feel.

D. Matching Final Ground Plan and Stage Setting

to the Gross and Character Movement

It is possible for a director to plot all the relation-
ships of gross blocking and character movement before com-
pleting his ground plan; but if a director has not settled
on a final plan at this point in his plotting here seems to
be the outer limit. Now he is aware of all the possibilities
of relationship of character and script to movement and area.
He needs no specific knowledge of the details of his panto-
mime and business to determine the ground plan. The one
element still needed is an understanding of the importance
of exits and entrances as beginnings and endings of French
scenes. However, he has already planned an important
position for the exit of the character if the exit is
important. It only remains now to place a door where the
exit is planned and to reconcile his concept of area meaning
to architectural design elements, or to an exterior setting.
It is not suggested that the process is a simple one. With-
out some knowledge of set design surely the director may
devise movement that is meaningful but that cannot take place
in the style of setting he desires.

The director is looking for a stage setting that will
in general allow for all the variations of movement and
position for which his blocking scheme calls. To be ideal
it should be a versatile yet unified setting with many
acting areas to allow for scenes played in small areas or

on the whole stage; it should be a setting with levels, such as Appia and Jessner recommended, that allow for vertical as well as horizontal picturization and give greater clarity to depth relationships; it should be a stage free enough from clutter so that the actor can in fact move freely in the area, and yet a stage with sufficient scenic units, props, or furniture to allow for motivation for movement to almost any place on it. Finally the director wants a setting with solids, forms, and textures that will provide contrast for, and hence emphasis upon, either the stationary, or the moving actor.

E. Matching the Fine Movement to Gross Blocking, Character Movement, Stage Setting, and Script Lines

After his ground plan is completed the director needs to plot his fine movement to match his gross blocking scheme. This fine movement will consist of the pantomime of each actor. The movement characteristics of each actor's role, character movement to interpret the relationships in each scene, and movement in the handling of stage properties, or business, and all specific body movements will be considered the pantomime, or what they do wherever they may be on stage in the blocking scheme.

The first step in plotting the fine movement is to see if there are any general principles of meaning to body movement, any kinds of movement that generally convey meanings

in the non-verbal pantomime context. In short, this study
will consult the authors of directing texts studied to see
how close they come to a language of pantomime.

1. Viewing Pantomime as a Language

Jacques Copeau said that the lines of arms and torsos
and knees of his actors spoke directly to the audience.[45]
The problem is to discover his language and to have some
reasonable assurance that it indeed communicates what he
thought it did; Copeau was not explicit in his writings.
It is one thing to proclaim that accurate pantomime will
communicate accurate meanings; it is quite another thing
to describe accurately what the symptoms and symbols are
and mean.

It seems to avoid the meaning issue to say with Gassner
that an actor, given a "thought line," will move naturally
and unselfconsciously.[46] If the actor fails to move thus,
Gassner could simply proclaim that the person is no actor.

The problem at issue is precisely what must go into
the actor's original training, or be supplied by a director
as an additional part of the actor's training, so that the
natural movements of an actor can portray whatever language
there is in pantomime. Certainly if the director can give
only thought lines to an actor the director has a very in-
direct tool for implementing any pantomime plotting.

---

[45]MacGowan, op. cit., p. 182.

[46]Gassner, op. cit., p. 142.

In any case, this study wishes to examine the use of the word "naturally." If by "naturally" Gassner means according to the actor's pantomime training, analysis of character, and in response to the director, then a thought line may be sufficient to move an actor "naturally" as the character he is portraying; however, such a use of "naturally" presupposes an actor knows some language of pantomime, has reached some agreement with his director on its use, and has made these pantomimic characteristics his own before the thought line is given. This process, however, does not seem to fit any normal use of the word "naturally"; it is a highly crafted process. In any case, Gassner's observation avoids the problem of the language of pantomime.

From Gassner's context this study assumes he is using "natural" in the neo-Stanislavsky New York method approach to acting. Many of the professional teachers of method acting there shun all approaches to studying general characteristics of emotions or attitudes or abstract, metaphoric, or symbolic meanings of body movement. Even character analysis is usually taught strictly in terms of psychological motivation except for certain extremes of physical deformity. Even the subject of bodily changes because of age is usually avoided since the actors are being trained for the type-cast market. For example, in her teaching sessions Stella Adler proclaims these physical elements to be "resultants" and are not to be considered by the actor;

Mary Welch, in her teaching, maintains if the inner thought is correct the outer form will naturally follow. The sense of her statement is that the actor, uninhibited by learning a body-language, will act naturally if his concentration is accurate, or, in Gassner's words, his "thought line" is good. Experiences with the American Academy of Dramatic Arts, Sanford Meisner, and Lee Strasburg all bear out that they have a similar approach to the pantomime aspects of acting. It is this study's opinion, from experience with Gassner and from the context of his book, that Gassner's use of though line resulting in natural, unselfconscious movement is part of the same context of method. Such an approach maintains that no general language of movement should be used by an actor, only specific movements that arise in the context of the play as the result of the actor's attempt to think in character.

Whether or not the above described position is that of Gassner's, Gassner does introduce a problem for the director interested in pantomimic language possibilities. Given the above described method approach, the actor tends to move as himself in the situation of the play, not as the character in the situation or as the thematic or non-mimetic require-ments of the play or director may demand. It is a common-place in the theatre that certain method and natural actors always play themselves. Given the type casting situation where an actor is cast because he mentally and physically

fits the director's conception of the character, the actor may never need to learn, nor the director to plot, any pantomime of the mimetic variety. Thought line would be sufficient. However, given the method approach, especially with the inexperienced actor who has not absorbed certain conventions through experience, an actor does not tend to move such as to keep oriented toward the audience or to keep within justifiable sight line conventions; nor does he tend to express the larger ideas of the play, only those of himself as actor, or at best those psychological characteristics wherein the actor may coincidentally resemble the character. It seems that one must agree with Selden that the rightly trained actor can move in rhythms, in stage conventions, and with stage diction and exaggeration; i.e., that nothing, to be understood by an audience, is really natural on stage.[47] So the answer to the method problem suggested by Gassner may be that an actor's natural moves as the result of a thought line can only be trusted if he has a mind and body trained in the special language of the stage and has a physical as well as a psychological character study completed and learned so that he will move automatically as would the character. Whether or not Gassner assumes it, such training is not stated or implied in his context.

In short, it seems that even to express the basic mimetic movement, the symbol standing for a real life

a

t

p

e

v

movement, conventions of stage movement may be needed. The unselfconscious move, of a thought line prompted actor, may only be a step in an actor's training, not a method of expressing meaning from the stage. After all, Clurman, in Gassner's book, has already pointed out that stage movement is a special language and the expert "author" of that movement is the director. As an illustration, certainly a French thought line for a French actor would not help the actor to express himself in English unless he first learned the English language. Similarly, it is not too much to expect the "natural" actor first to learn the special languages of the stage before expecting him to express himself with only the aid of a thought line and natural processes.

Gassner may well be right in condemning, as he does, any pat system of pantomime that purports to be realistic, to be founded on psychology, and to call upon some special set of conventional moves and positions to portray certain emotions.[48] He does not state what system he refers to though in context it appears to be Delsarte. For Gassner to condemn a supposedly realistic system devised fifty years or more ago from a religious, or mystical, classification of primitive psychological data is one thing. To condemn all systems of portrayal of symptoms, or of conventional signs for emotions, because some systems are outdated appears hasty. It appears

---

[48]Gassner, op. cit., p. 143.

analagous to condemning all psychology because a fifty year old psychology is outdated.

For an actor to duplicate, or reinstate in his body, symptoms of emotions, of age, or of disease with accuracy, and then to work to make these symptoms an organic part of his natural movement, is not more artificial than to take the author's words, character, and situation and to work to make them part of himself. Perhaps worse still, in tossing out outmoded systems of pantomime, a director may toss out the good with the bad. For example, Dietrich, who also holds symptomatic portrayal in distrust feels there is a place for the accepted conventional symbol, and that its roots are in natural behavior. He states that stereotypes, conventions, or physical symbols for emotion often result from certain characteristics having occurred enough in human behavior so that the stereotype develops.[49] In effect, then, there is some natural behavior at the root of even the stereotyped action. It is the contention of this study that it is a valuable procedure to try to discover principles of real life movements and the roots of stereotyped movements so that a director can have a check on the actor's intuition and the director's own planning.

2. Viewing Pantomime as Having Three Modes of Meaning

There begin to appear, according to the authors studied,

---

[49]Dietrich, op. cit., p. 165.

three approaches to how pantomime may have meaning. They correspond in part to this study's four part division of abstract, mimetic, metaphoric, and symbolic, but are expressed usually in a different kind of sequence ranging from most natural to most unnatural within the realm of recognizable human movement; however, a relationship between the two classification systems will be suggested.

a) <u>The Three Modes Defined: Natural, Heightened Natural, Symbolic.</u>--There are two divisions of the natural mode of pantomime both of which this study would classify as mimetic. There is the American method actor's view that the correct inner thought will yield the correct outer form, and in an organic way; voice and body will express a unified human being and be true to life. Then there is the approach, which can be combined with method, that allows for the actor to add natural body characteristics to his portrayal, characteristics that may result from physiological or psychological knowledge about human beings in general or a- bout his character in particular. In both divisions the result is hopefully a reasonable facsimile of a natural human being.

The second mode, heightened natural pantomime, is closest to the view expressed by Selden, Dietrich, and others that real human behavior is apt to be too small, too dull, or too undifferentiated for clear communication from the stage, and so methods of heightening the natural are

needed for the stage. Such heightening can be a simple enlargement of natural movement, or it can also be the elimination of certain less dramatic details of body movement, sometimes called selective realism, which for this study would be a sort of mimetic symbolism.

The third mode, or symbolic pantomime, is classified into the three categories of abstraction, metaphor, and symbol by this study. The symbolic view seems to be that the body should not try to imitate nature's moves at all in verisimilitude or in a mimetic fashion, but rather the body should be made to express by symbol, by metaphor, or by some special language the inner or universal truth of the character, the society, or the play. Of course the third mode of meaning can combine quite easily with the heightened natural mode to create characters heightened and distorted in their pantomime by abstraction, metaphor, and symbol. However, for the purposes of this chapter, esoteric, pure symbolic, forms will not be considered.

b) _Natural Pantomime Explored_.--The American method actors' school of thought expresses the first division of natural pantomime, wherein the actor's pantomime is the result of thought lines or inner feelings rather than superimposed physical characteristics. Gassner's view reflects this school of thought, a school whose views are probably more extremely thought centered than Stanislavsky's from which the view supposedly originated. The view has been

ade

the

vie

fro

tha

cor

maj

em

mo

in

ob

th

a

n

t

a

h

adequately expressed on pages 182-186 of this study.

Somewhat surprisingly, Canfield, whose emphasis is upon the craft of the theatre, seems to hold the natural pantomime view. He states that in good acting the emotion proceeds from a sense of truth within the actor.[50] It would seem that Canfield, within the natural mode, ought to give some consideration to the view that in good acting the emotion may proceed from an accurate and artistic depiction of emotion based on a study of how people actually behave and modified by whatever conventions are necessary to carry the impression of a truthful emotion to the audience.

In any event, this study is more concerned with the observable results in pantomime than in the method by which the actor or director arrives at those results; and soon as a director maintains the view of the second division of natural pantomime, the addition of pantomimic characteristics by design rather than by an actor thought process alone, he usually allows exaggeration and selection, hence his observable results belong more in the next mode.

c) Heightened Natural Pantomime Explored.--Such men as Dietrich and Selden express ideas that place them more in the heightened natural mode of pantomime, but they use mimetic principles and incorporate symbols as well; however, usually the symbols are merely stylized and conventionalized mimesis.

---

[50]Canfield, op. cit., p. 166.

They question chiefly how much pantomime is in fact natural expression, how much is learned convention, and how much is not a language but is dependent on a verbal context to give it specific meaning.

Dietrich has two important contributions to make to the mode of heightened natural pantomime. The first is a contention that may cast doubt on the possibility of communication by simple natural mimesis, the contention that psychologists have found that the physiological changes in emotion seem to be similar, if not identical, regardless of the emotion experienced. Emotions are all patterns of disorganization.[51]

The second is a contention that follows from the first; as a result of the psychologists' findings the audience would need the play context and conventional symbols of emotion in order to differentiate pantomimic emotions. One of the conventional symbols that Dietrich mentions is the emotional stereotype.[52]

The stereotype is easier to deal with than the psychologists' findings. It would appear to be a form of the heightened natural in pantomime. It derives from natural behavior that has been exaggerated and conventionalized until the audience thinks of the symbol as a true symptom. If the emotional stereotype is accepted as a real symptom of emotion by the audience, and is performed in a way

p

w

b

l

v

p

appropriate to the character and situation, then neither this study, nor Dietrich evidently would disapprove of its use. Here is a theatrically acceptable mode of a symbolic communication of emotion.

Dietrich's first contention, that the physiological changes are the same regardless of the emotion experienced, would seem to make the stereotype not only acceptable but necessary. The contention is difficult to harmonize with the view that there may be an understandable mimetic language to be heightened.

The problem, however, seems more concerned with the context in which the word "emotion" is used than with the psychological aspects expressed. In Dietrich's context the word "emotion" seems to apply to the basic changes in heart beat, blood pressure, breathing rate, and muscle tension. If these symptoms express the meaning of "emotion" it may well be true that all emotions are symptomatically alike. However, this meaning perhaps unnecessarily restricts the use of "emotion"; emotion would no longer pertain to any observable and felt state corresponding to such feelings as anger, fear, hate, and love. "Emotion" would then have a more basic meaning such as the preparation for action the body makes at the time of any change in feelings.

What else need be added, then, before words are spoken, and before stereotyped symbols for emotion are used, to give some observable direction or feeling tone to the basic

phy

p

u

c

r

physiological symptoms? Is there anything else, as some authors feel, that is still a part of the natural, physical, emotional behavior?

Dietrich himself gives this study a direction in which to look for the solution to the problem of seeming disagreement among authors. He mentions that the visual projection of emotion, as it is rooted in actual physiological symptoms, concerns muscle tension and relaxation; there are also contracted and expanded states that are symptomatic of unpleasant and pleasant emotions.[53] These are symptomatic conditions that seem to add another dimension, actual posture, to such symptoms as heart beat and breathing rate.

Perhaps once all the body characteristics that accompanyy undifferentiated emotion are studied as symptoms, that is, which muscles are expanded or contracted, what qualities and rates of breathing are involved, and what facial expressions are seen, then greater differentiation of emotions can be perceived. Perhaps this is, in effect, putting the basic undifferentiated physiological symptoms of emotion into a context; however, it is still only a pantomimic and mimetic, not yet either a verbal or symbolic, context.

This study feels that a word other than "emotion" can be employed to mean the total set of symptoms that include posture, body set, and typical movement reactions, but that

---

[53]Ibid., p. 162.

do not include the context of a character in a play; the
term "body attitude" may be appropriate. Such attitudes
may well be responses that are consistently and naturally
differentiated even though the organic symptoms show little
differentiation. In short, even though a knowledge of the
play situation is imperative to the recognition of the
specific emotion, even as Dietrich says,[54] still the play's
situation may be known to a great extent from its pantomimic
pattern, derived not from the stereotype of emotion alone
but also from assumed body attitudes similar to what a real
person might naturally assume in a real life situation. At
least, as will be seen, Selden seems to think so.

Selden includes as symptoms of emotion what this study
has just defined as emotion and body attitude combined. He
feels that primitive emotions can be expressed with body
positions, both in movement and in repose; such emotions
include grief, despair, humility, indecision, and joy.[55]
He bases this supposition on a theory that there are really
accurate and differentiated movements and positions for
emotions but that social restraints, by custom, have been
put upon the basic strong moves of biology.[56] His lesson
for actors is, then, that a copy of the symptoms of emotion,
as found in their present cultural context, would not be
either large enough or differentiated enough to be "read"

---

[54]Ibid., p. 164.

by an audience; hence, the audience needs "hints" of the larger, primitive emotion that is underneath the restrained exterior.[57] In effect, Selden counsels to produce in outer form the inner response that isn't normally seen.[58]

That such symptoms can be known, and hence expressed in their larger form, is to some extent assumed by Selden, but he does give some principles for guidance. He feels that the waist is the controlling point for primitive action.[59] Similarly, all sincerely motivated gesture originates at some central part of the body and extends to the extremities; it does not originate in hands or feet. The extremities symbolize in their gestures man's desire to make or break contact.[60] However, since most of his principles of meaning of body areas, mentioned above, originate with Delsarte, this study will postpone discussion of them until part II that deals with the modern exponents of Delsarte.

Selden also suggests, in the heightened natural mode of pantomime, simplification of movement to carry the essence of the move, especially when several people are moving.[61] His view is what this study calls selective natural pantomime, an editing of the strictly mimetic to create a heightened natural effect.

d) <u>Symbolic Pantomime Explored</u>.--It is appropriate to note that, although this study suggested that one method of

---

[57]<u>Ibid</u>., p. 79.   [58]<u>Ibid</u>., p. 93.

[59]<u>Ibid</u>., p. 86   [60]<u>Ibid</u>., p. 92.   [61]<u>Ibid</u>., p. 273.

heightening the natural in pantomime could be through the addition of symbolic features, so far the views of heightened natural pantomime have been characterized by suggestions to exaggerate and to delete parts from what are basically natural human moves. Methods of incorporating non-mimetic movement seem to come primarily from the expressionist-symbolists.

As an example of the symbolist view, Appia proclaims that the human body, as theatre's means of expression, must forsake the caprice and accident of life and try to express its essential characteristics, its most important ideas, more clearly and fully than in normal life.[62] He enlarges somewhat on this concept by saying that the human body must undergo a "modification of relationships".[63] In his context, it is apparent that Appia means the body should be subject to the same principles as any other art. It should derive its material from nature, from the natural behavior of the human body, but should so order, arrange, edit, simplify, emphasize, distort, and otherwise pattern nature that the end product is anything but nature; the result is art expressing a definite point of view about nature and society. He feels this is no more or less than should be expected of any art. However, just what his methods were, and what results he achieved, he does not explain.

---

[62]Appia, op. cit., p. 24.

[63]Ibid., p. 55.

Beyond Appia's view, pantomime would become an esoteric special symbolism divorced from movement that is human. Each such system is a language unto itself and not of interest at this point in the study.

3. Viewing Pantomime as an Adjunct to Script Lines

In this section the director comes closer to the detailed relationship of movement to script. In it the use of properties and business, as well as the amount, duration, intensity, and placement of moves in relationship to script lines, will be discussed. According to the authors studied movement's functions in this regard appear to be to emphasize, to support, or to counter script meanings.

a) Movement to Emphasize Script Lines.--Most of the books analyzed relate movement to lines in terms of emphasis rather than meaning. The line is evidently considered, in most cases, to carry the meaning; whereas some moves have the purpose of maintaining good sight lines so the emphatic character or object will be seen and heard. Here the meaning again is assumed to lie ultimately in the words of the speaker, or possibly in the action of the dominant character. The directing texts are not very explicit on how to make that dominant action meaningful; mostly they provide a variety of ways in which to point to it. Also there is little analysis of what qualities of meanings various methods of gaining script line emphasis will have; usually there is only the relative strengths of the emphasis and

the methods of keeping the focus where the director desires.

Although this study is more concerned with the meaning
that movement contributes to lines than with movement's
function of drawing attention to those lines, the first
step will be to poll the methods of gaining emphasis in
order to have them available in discussing later their
possible special qualities.

1-General Relationship of Movement to Lines. MacGowan
suggests that characters in a group should remain immobile
while the principals are talking.[64] The obvious reason is
to have no distraction from the main action, though he fails
to solve a problem of life-like-ness. If the characters are
truly immobile they serve little function in the scene; they
are apt to appear inhuman and contrast with the principals
almost as a painted tree does with a real tree.

Fernald suggests a principle of "one effect at a time";
where movement is of "dramatic significance it should not be
accompanied by dialogue"; and where "dialogue is of partic-
ular dramatic significance, it should not be accompanied by
movement".[65] On the surface this seems to contradict a
principle of Shaw's, that there should rarely be any silence
on stage; it also would seem to contradict a general prin-
ciple of Dietrich's, and others, that in general the length
of move and length of line coincide unless special emphasis

---

[64]MacGowan, op. cit., p. 139.

[65]Fernald, op. cit., p. 44.

is to fall on one or the other.[66] It seems that Fernald is saying in general that if either is to have "dramatic significance," that moves should be made without words and words be spoken without moves. It would also appear on the surface that Dietrich suggests that usually a move of the speaker starts and ends with the speaker's line. On closer inspection, however, the two ideas may combine to reveal important principles. Dietrich points out that an actor generally moves on his own line and generally moves throughout his line, be the move a distance-covering move (gross blocking move) or merely pantomime while the actor is stationary. Generally the actor stops movement and speech while another actor takes over both movement and speech.

Both Dietrich and Fernald point up important principles; to avoid divided focus between actors, the mover is the speaker; to avoid divided focus between movement and speech, the one is stopped while the other continues in sole focus.

This study would like to suggest a corollary to this latter principle; a character who is not speaking at the moment may attract attention to himself by movement. The attraction has its negative value of distraction, but it also has a positive value. It can help to maintain a sense of interaction even though only one person is speaking, or it can provide comment or punctuation to a long speech.

---

[66]Dietrich, op. cit., p. 127.

With these uses in mind MacGowan's idea of the motionless
crowd may well be replaced by an idea of judicious, care-
fully spotted, crowd movements to show a crowd interaction
with the principals. At other times the crowd may follow
Selden's advice and remain alert, involved, and interested
while being relatively motionless.[67] The crowd can also
follow Selden's suggestion to make only simple, typical
moves even during their times of activity.[68]

Dean concurs with both Dietrich and Fernald when Dean
suggests that a movement on a line may call attention to
the speaker and give him emphasis; but he adds that the
movement may also cloud the meaning of the line.[69] His
advice is to analyze the line to see if the line carries
its meaning by itself or if it needs the move to clarify or
intensify its meaning. He is, in effect, suggesting the
avoidance of redundancy and of competition between line and
move. Gielgud and Krows, as has been seen, would rather
avoid moving at all if there is any chance of the movement
interfering with the words.

Dean further suggests ways of softening a move if the
move must be made by the nonspeaking character; the latter
may, for example, be pacing during a dialogue; in which case
he may pace in a weaker stage area while the speaker stands
in a stronger stage area.[70] In general he says that a play

---

[67]Selden, op. cit., p. 65.   [68]Ibid., p. 273.

[69]Dean, op. cit., p. 239.   [70]Ibid., p. 241.

of ideas is apt to have less movement, while a play lacking in thought is apt to have more movement.[71]

Dietrich has additional suggestions concerning violent action in relation to lines. When fighting or physical violence must occur on stage there is a tendency for it to take all of the focus and leave little for the words. In effect his suggestion is to find ways of saying the lines during quieter moments preceding, or during lulls in, the violence and to surge into bursts of violence that involve only a few words.[72] Such actions may be plotted in waves of quiet and activity throughout a scene, with a climax of violence; or they may be in a progression, building from quieter moments to a violent scene. It seems that such alternation of emphasis would successfully maintain an alternation of focus from speech to movement, following the same principle of "one effect at a time" expressed by Fernald. It might be added here that words may not be out of place during the violence but, following Dean's suggestion about plays that have less thought and adapting it to the violent scene in any play, perhaps a dialogue of less thought could be allowed during the violence. For example, primitive sounds, ejaculations, repeated ideas or themes, or slogans might help to carry the force of the violence without competing with the violence.

---

[71] Ibid., p. 258.

[72] Dietrich, op. cit., p. 155.

202

Selden agrees with the above authors and suggests the
principle that a story must move forward every minute; when
the action cannot progress outwardly, it must continue in-
wardly.[73] Dietrich's and Selden's ideas may combine
profitably this way: when the physical movement is strongest
the dialogue is weakest; when the dialogue is strongest the
movement is weakest.

2-Specific Relationship of Movement to Lines. When the
director comes to specific kinds of lines and situations
there is a catalogue of conventional stage movement, and
certain basic principles, to consider in terms of emphasis.
The catalogue seems to divide into two general categories:
movement to point up an important line or character, or
movement to deemphasize an unimportant line or character.
In effect the two are often complementary and sequential;
the latter move helps to make way for the former.

Such moves as are concerned with exits and entrances
seem to be the most prominent in the above category.
Dietrich suggests that an actor must disappear from sight
at the conclusion of the exit tag, or tag end of his line
or movement; the reason is to allow attention to revert
back to the actors on stage.[74] Dietrich points out that an
additional move, in the wake of the departing actor so to
speak, may help to emphasize the exit in case attention is

---

[73]Selden, op. cit., p. 199.

[74]Dietrich, op. cit., p. 137.

not wanted elsewhere immediately; a pause may accomplish the
same emphasis with eyes focused on the exit. Dietrich also
points out that exits and entrances are often climaxes to,
and limits of, the motivational units.[75] Hence, they must
be constructed with care and usually with a high degree of
emphasis. To aid this purpose most of the authors list such
moves as up stage counters, movements to upstage to prepare
a character to be in focus, isolation moves, and all of the
previously discussed compositional movement elements. These
moves are discussed by Canfield in terms of their function as
conventions to allow the important elements to be seen and
heard in a proscenium, to uncover the point of interest and
draw attention to it.[76]

Dietrich suggests that a line following a move empha-
sizes the line, while a move following a line emphasizes
the move.[77] The principle in general is that what happens
last in a sequence gains the most importance. Also, the
initial sound or sight draws attention to the actor and
then leaves an undivided focus on either the sight or the
sound that follows. Dean agrees with Dietrich when he says
that a move before a line emphasizes the line; a move after
the line emphasizes the move.[78] He adds that a weak move

[75]Ibid., p. 138.

[76]Canfield, op. cit., p. 168.

[77]Dietrich, op. cit., p. 128.

[78]Dean, op. cit., p. 234.

after the line still emphasizes the line; however, his
addition leads to a questioning of the whole principle.

There is a danger in what Dean says; it seems the
weak move following the line may weaken the line. Movement,
drawing attention to itself, may keep the audience's
attention for some seconds after the line and actually
supplant the line; or the move may be thought of by the
audience as a comment upon the line, since the speaker is
making the move. The movement being weak could tend to
undermine the strength of the line, tend to extend the line
into a petering-out movement.

Another interpretation of Dean's observation seems like
a good example of emphasis but not an example of a move that
is weak. A single move or gesture followed by an exit, or
a repose, could have the effect of a punctuation mark, and
hence could strengthen the line preceding it rather than
call special attention to the single strong move itself.
A quick flourish for an exit, for example, may punctuate
a line and give it greater importance. To be sure, the
movement is last and makes a strong impression; still, it
is a supporting impression; the move underlines, rather
than supplants the script line. But such a punctuation mark
would be considered by this study to be a strong move.

It seems that the most sympathetic treatment of Dean's
principle would be to consider that the very weak move, one
that takes the actor almost immediately out of focus, per-
haps even off the stage, will leave a sort of visual vacuum

where the actor was. In addition to saying "nothing more
of importance is coming from this character at the moment,
so remember his last remark," the vacuum can help to elimi-
nate any strong visual image following the line that might
distract from the line. Such a move borrows some of the
effectiveness of the "black-out," where a sudden elimination
of light will leave the audience with a strong impression of
whatever was last seen or heard. In either case, the place
where the audience's eyes were focused will no longer have
a strong visual point of interest. On the lighted stage,
as long as the rest of the stage picture is maintained
relatively static after the weak movement, there will be no
immediate distractions from the emphatic line.

Of course, such a "vacuum" is usually only felt for an
instant, and with much less force than the "black-out," but
the impression is strong enough to create some emphasis.

b) <u>Movement to Support Script Lines</u>.--Related to the
way a move may emphasize a line is the way it may support.
In addition to drawing attention to a particular line, a
move may give the line either strength or weakness and may
even be able to add some nuance of specific meaning that
correlates positively with the meaning of the script lines.

Dean suggests the director may correlate a strong move
with a strong line.[79] His suggestion is based on a previous
view of his that each sentence of a play has an inherent

---

[79]<u>Ibid</u>., p. 234.

movement, even if it is a static move; i.e., pause, or rest.[80]
If the director finds the inherent move he can match it to
the line. Such matching can be compared to Smith's symbolic
moves that supposedly grow out of lines that contain such
elements as inherent approaches, or encirclements, or
separations. In the same context Dean suggests that the
director may interpret the author's change of meanings that
occur line by line by choosing the appropriate set of
changing moves.

1-Support Through Duration. Another means of support for a
line is by the duration of a move. How it may support is
somewhat complex. Dean proclaims that a long move is
generally weaker than a short one.[81] Dietrich supports
Dean's view by saying that the audience quickly perceives
the meaning of a movement so that if the movement takes too
long, interest wanes.[82] These two statements can be
puzzling. It would seem that the general opinion supports
the idea that a static scene is tedious. If true, Dietrich's
statement may well be altered to say that an audience may
quickly perceive the meaning of a still picture and interest
wanes. It would seem that, given a choice, the director
might well sustain interest longer in a long movement than
he would with a long still picture. However, when the
length of a move is considered in conjunction with a script

---

[80]Ibid., p. 234.   [81]Ibid., p. 226.

[82]Dietrich, op. cit., p. 127.

line, Dietrich's point of view seems to alter. As has been
pointed out, Dietrich has suggested that a norm is for the
length of the move to coincide with the length of the line.
Then a long line may well mean a long move. To combine
his statements sympathetically may result in the conclusion
that a long move unaccompanied by lines, may be tedious; that
is, when complete emphasis is on the move its meaning may be
discerned quickly and the audience become anxious for dia-
logue to continue. However, the speed of understanding would
depend upon the ingenuity of the director. Perhaps the
audience is equally able to discern the meaning of the move-
ment, i.e., action, of the plot and can see where the plot
is going; hence the scene should be written in a less obvious
way or cut. The same principle can hold true of movement.
The director need not be obvious; he may provide a movement
sequence, as in dance or in wordless pantomime, that has
the same build, suspense, and climax as a written script.
2-Support through Realism. Another variety of support that
movement can give to lines is psychological realism. When
Boyd reminds an actor not to back into a move, he is using the
principle (without so saying) that in general people do not
orient themselves to where they have been but to where they are
going.[83] When a character goes toward a point of interest
he is oriented toward it until there is a new point of
interest; then the character may turn toward the new point

---

[83]Boyd, op. cit., p. 89.

of interest. Therefore, the convention of "not backing into a move" really calls into play the whole context of psychological motivation of moves.

Perhaps a more important psychological relationship between move and line is the natural order of human reaction. Dietrich maintains that the gesture normally coincides with the line; a mistimed gesture after the line is for comic effect.[84] Possibly, however, even in drama a gesture, in the rhythm of the speech, after the line may support, and, in effect, supply the place of punctuation for, the line. The gesture in effect may tell the audience what the punctuation is and may also help to maintain the rhythm of the scene. The gesture may also have the advantage of not interfering, by either excess sight or sound, with the line itself. Specifically annoying is the pounded fist that obliterates the last, and usually the most important, phrase in the line.

There is still another problem with the timing of gesture or reaction moves. Emphasis as discussed above is primarily of aesthetic or thematic interest. Timing that is concerned with psychologically motivated characters involves a different point of view and possibly a different timing. There seems to be an easily observed reaction pattern in human behavior; according to the teachings of Louise Gifford, pantomime consultant for Theatre Guild in New York, it seems

---

[84]Dietrich, op. cit., p. 150.

that in normal human behavior gesture precedes speech. Of course physical reaction may come during a speech but the reaction is generally in advance of the part of the speech that expresses that reaction, i.e., a thought or emotion results in overt movement, a new body set, and finally in speech. The principle is that emotion and the accompanying physical symptoms precede spontaneous sound, such as ejaculation, which in turn precedes verbalization. Certainly the problems and possibilities of the idea of the sequence in a reaction pattern can be very important to both realistic and stylized movement and emphasis.

3-Support through Prop Handling. Movements that accompany the handling of props may partake of the same abstract formal qualities of any other movement and also resemble, or stand for, a similar movement as it may be found in a real life situation. The additional elements are the positive and negative uses of the prop itself.

Negatively, a prop adds another element to a composition; it may steal, take, or at least divide the emphasis and be distracting; if lines and movements are both involved with the handling of a prop then there is a three way, rather than a two way, split in focus. Positively, the prop may be handled on simple supporting levels, such as to reinforce the director's notion of the meaning of the line, the character, or the situation.

As an example, Dietrich refers to the use of the telephone in The Voice of the Turtle where the phone becomes

a symbol presumably for the party at the other end of the line; the phone is threatened, cajoled, caressed, and beaten to point up the attitude of the speaker on the phone.[85] Dietrich separates the above two basic meanings into denotative and connotative. In terms of this study, "denotative" comes closest to the simple correspondence that stage movement would have to real movement in a similar situation in real life. Connotative would be closest to the additional comments that a move makes about the line, either to support, to supplement, or to contradict.

c) Movement to Counter Script Lines.--Up until here only two varieties of relationship have been used: methods of gaining emphasis for line or move, and ways of supporting the line with the move. In other words, the concern has been to clarify the line by underscoring it or by supplying it with moving buttresses that substantially say the same thing as the line.

To alter a line meaning, to embroider it, to give it new qualities, to comment on it, or on the characters saying it, or even to deny the truth of the line entirely, is an editorial function of movement that can be of great importance. In a sense such a movement usage can provide a whole new sub-script. A simple example would be a retreat move during a line that suggests positive attraction. The movement comments that the character does not mean what he is

---

[85]Ibid., p. 147.

saying. Such a move may carry the emotion that underlies the surface of words; it may carry the theme, mood, or metaphor of the play that underlies and connects the movement-to-movement meanings of the script; or it may provide a commentary on some absurdity of the surface meaning of the script or the insincerity of some character.

Harold Clurman states that in a sense the playwrights text disappears the moment it reaches the stage; the text becomes a part of an action; the change of a gesture, inflection, movement, rhythm, or physical background of the speech may give it new significance.[86] A movement that contradicts, or at least contrasts with, the line holds in its juxtaposition the power to create a depth, a dimension, and a comment that the line itself could not achieve.

The principles of the meaning of the moves, as proposed by the chosen authors, have already been discussed. It is up to the director, in his initial analysis, to discover counterpoints in the script, or to invent them if need be, in order to bring depth of theme, emotion, or attitude to the surface speech; the director may do this harmoniously by support or contrastingly by purposeful mismatching.

    F. Matching Timing to the Movement: Discerning and
          Plotting Tempi and Rhythms Appropriate to
          the Script and the Movement Plan

---

[86]Cole, op. cit., p. 276.

The one dimension left for the director to consider in
the meaning of his movement is the rhythmic use of time.
Rhythm and tempo have a powerful and relatively undeveloped
potential for stage movement meaning. Because of rhythm's
kinship to nature its potential for metaphoric and direct
empathic meaning is great. Because of its integral re-
lationship to music, rhythm's potential for direct symbolic
and associational meaning is also great. But rhythm's in-
clusion in the movement of a script seems to be both easy
to discuss and difficult to accomplish, possibly, in part,
because many directors do not plan for rhythm early enough
in their blocking scheme. Rhythm needs to be plotted into
the selection of French scenes, gross blocking, and fine
movement in order to implement most successfully the
rhythmic principles decided upon in early thematic analysis.

Of course, in part, the difficulty of including rhythm
to its greatest potential is the script itself. Most
contemporary scripts simply do not have, nor are they
expected to have, the built-in and clearly recognizable
rhythms of either nature or music. In any case, it seems
that many directors choose to wait to bring rhythm into
their movement until they have specific blocking, fine
movement, and script lines as material to organize into
rhythmic patterns. This study does not oppose that procedure
so long as the director has blocked his rhythmic scheme into
the play at an earlier time, merely saved the last phases of
rehearsal to concentrate on timing factors.

1. Tempo and Rhythm Defined

Dean says that rhythm consists of a sequence of impressions, ordered into a recurrence of accented groups,[87] and that tempo, in essence, is the speed of the established rhythm.[88] Dietrich substantially agrees with him.[89] For this reason rhythm will be discussed first and then tempo will be added to rhythm.

2. Purpose and Function of Rhythm

The function of rhythm is thought of variously as anything from a training in grace for actors to a basic means of empathic communication.

Ernst Ferand believes in training actors so their bodies and speech can move in any rhythm or tempo that music or line of design in a play may require.[90] However, his concern is not with what the rhythm may communicate so much as it is with the grace, efficiency, and versatility rhythm may supply the actor.

Canfield notes briefly that rhythm adds empathy because it helps the audience to "get with" the play.[91]

Selden expands this notion to suggest that rhythm is one of the basic stimulants for an audience. However, for

---

[87]Dean, op. cit., p. 284.   [88]Ibid., p. 288.

n

i

t

s

c

(

.

now the study still concerns what the director believes he
is expressing, not what the audience is actually receiving,
though with rhythm the distinction is difficult to maintain
since the authors studied discuss the qualities of rhythm
chiefly in terms of empathic audience response.

As to their function in a play, pulsations and rhythm
express, according to Selden, health and a feeling of well-
being.[92] Rhythms express general feelings which become
specific in the context or pattern of the play.[93] Selden
also feels that modern man has repressed his natural movement
reactions to emotion, but that music, with its rhythm, has
to a large extent taken over as the media of emotional ex-
pression.[94]

In general, then, the functions of rhythm seem to be to
convey emotions and moods, that rely in part on the play
context and in part on prior association for their meaning,
and to induce direct empathic reinstatement of rhythms into
the audience while the rhythms are being expressed on stage.
Such reinstatement would supposedly carry with it whatever
emotions or attitudes the rhythm has. It may function to
support the script, by underlining the meanings and rhythms
of the script, or it may provide comment, or counter mean-
ings.

---

[92]Selden, op. cit., p. 20.

[93]Ibid., p. 29.

[94]Ibid., pp. 35, 38.

3. Sources for Rhythm Meanings

Selden makes the broad statement that the world is made up of rhythms.[95] Rhythms for adaptation to stage purposes can be found anywhere. The body, perhaps, is the chief source, as most authors agree. For example, Dean draws attention to the heart beat and breathing rhythms as basic sources.[96]

Dean also believes that each character and each scene, as well as the play as a whole, have their own rhythms.[97] The problem of the director is evidently to discover these contributing rhythms and to coordinate them into an over-all rhythm of the play. Usable script rhythms seem to emerge from two sources: from the rhythm of the words and from the way the script stimulates the director's imagination. The former derives from the length of the lines in dialogue, length of words, relationship of the phrases, and a larger rhythm of the temporal relationship of French scene to French scene. It would seem, though, that the script only provides a springboard to the director's imagination. How he conceives of the phrasing, the pauses, the accents, or the emotional background of the character may indeed derive from the script and be consistent with the script but it can hardly be said to inhere in the script; otherwise each

---

[95] Ibid., p. 46.

[96] Dean, op. cit., p. 284.

[97] Ibid., p. 285.

director would tend to evolve the same rhythms for the same scene as inevitably as each uses the same words. Such is simply not the case. The director's imagination, then, seems to be the most important factor in the finding of rhythms.

Selden suggests a process of discovering script rhythms in his discussion of buried rhythms. He feels that there are rhythms to be discovered in passages that are not obviously rhythmical.[98] He adds that buried rhythms add values of perspective and expectancy through repetition, values that neither life nor the script makes obvious often enough to be noticed.[99] Phrasing, which has been discussed under motivational units and French scenes, is also a source of rhythm discussed by Selden; however, he mainly stresses rhythm's function in compositional emphasis, and in aiding comprehension.[100]

Suffice it to summarize and to anticipate here that the meaning of rhythms probably arise in the same way as the meaning of movement, i.e., by association with natural rhythms, with cultural rhythms, and with the specific language of rhythm which is music; in other words, there are rhythms that denote, by direct imitation, the bodily functions of heart beat, breathing, walking and running; that connote

---

[98]Selden, op. cit., p. 62.

[99]Ibid., p. 184.   [100]Ibid., pp. 56,184,185.

nature's functions in the four seasons, day and night, and animal movement; that connote cultural functions, such as rhythms in machinery or in ceremony; or rhythms that derive from the direct language of rhythm, music.

Music can establish meaning to rhythm by all of the above associational means, but obviously music has gone far beyond the nature from which the rhythms were abstracted. Now the rhythm of the music itself can express directly a country, a mood, a dance, a level in society, or any number of special locales. By use of the rhythm found in a selected piece of music the director can, by association with the music, help to establish the same mood as the music would have established.

Ultimately, then, rhythms may derive from the actual rhythms of the script or from rhythms in nature, in culture, or in music. The rhythms may be consistent with the script but are not really inherent. Most rhythms may be suggested to the imaginative director by the script but they usually must be derived from other sources.

4. Tempo Added to Rhythm

Tempo is the time measure of rhythm; it is defined by Dietrich primarily as the impression of rate of speed of the rhythm rather than the actual speed.[101] As such, a changing tempo may give an audience an impression of a growing calm or of a growing excitement, may actually communicate that

---

[101]Dietrich, op. cit., p. 176.

excitement by empathic means, but primarily its meaning is, like compositional emphasis, contributory. As the rhythm has meaning so the tempo will stress that rhythm and its meaning. The rhythm carries more meaning than the tempo. However, the rhythm needs a specific context for a specific meaning so it in turn is contributory, by giving special qualities to specific movements or speech. In turn, the movement that is made rhythmically may carry a more specific meaning than the rhythm alone, but the movement needs the verbal context to make of the situation a unique individual occurrence with a meaning that is all its own.

Certain uses of tempo seem best attended to early in rehearsal and others seem appropriate for inclusion in the final phases. Dietrich points out that one normal element in tempo is the fast cue.[102] Its primary purpose is to maintain concentrated attention. Such a tempo manifestation need not be part of advanced preparation by the director. However, Dietrich's observation that tempo is more the impression of speed than actual speed gives rise to conjecture on the part of this study that some of the elements of tempo seem best attended to early in plotting and blocking. Such time factors as a sequence of sharp contrasts, or an increase of accented beats, or a series of staccato movements must be part of the basic composition to be most integral and effective.

---

[102]_Ibid._, p. 174.

In plotting rhythm and tempo to match the scene, Dean's general suggestion is that the rhythm of a scene should remain constant but that the tempo should vary.[103] The presumption evidently is that once the rhythm has helped to get the audience with the play, the rhythm should be maintained to keep them there; then by increasing the tempo the excitement is heightened to a crescendo to maintain and increase that interest. The inference is that the rhythm is a basic quality of the scene as much as atmosphere, locale, or mood; hence the time changes should be in quantity rather than in quality. However, if the rhythm is derived from character rather than from locale, or from mood, or metaphor, possibly the scene may have to alter in rhythm as well as in tempo.

The application of rhythm and tempo to a scene becomes largely, it seems, a problem of continuity vs. change. Some principle of rhythmic continuity ought to be maintained for the audience to realize it is watching the same scene; some principle of change seems to be needed to insure equal or heightening attention and excitement.

Perhaps a compromise suggestion would be to establish a basic beat for a rhythm and then to introduce new elements to the beat as new elements are added to the scene; more beats, contrapuntal beats, beats that half the time, or syncopate the beat, depending upon the new mood or entering

---

[103]Dean, op. cit., p. 287.

character. Thus the director would maintain his continuity but would have two principles of variance to increase interest.

5. Production Elements That Communicate Tempo and Rhythm

One of the biggest problems of the director is in specifics. What exactly will carry the rhythm? Of course the general answer is simple: all of the visual and auditory elements on the stage taken together. But how? Little advice is given at this point by any of the direction and production texts. Movement's form, mass, line and pattern; dialogue's punctuation and pause; business' pantomime and prop handling; scenic elements of furniture, exits, and setting; the sound effects and musical background's direct beat, such as the drum beat in Emperor Jones, all have to cooperate to carry the rhythm. Obviously rhythm is not something superimposed at the last minute; it must be a part of the basic analysis and built into the blocking even though it may not be consciously stressed until run-through rehearsals.

G. Summary Conclusion: Challenge to Make Pantomime Serve a More Useful Communication Purpose

It seems then, in matching fine movement to gross, there are many general possibilities for the meaning of pantomime apart from its handling of properties or its relationship to lines; pantomime may express formally through its use of line, mass, shape, tempo and rhythm; it may express

psychologically and realistically by verisimilitude, by the actor's doing what he would do if he were in the character's situation; it can express with heightened realism by enlarging the real symptoms of behavior to a recognizable size; it may express emotion or idea symbolically by the use of accepted conventional stereotypes of emotion; it may express metaphorically by using shapes and characteristics of moves of other animate life or of moving objects in culture or nature; it may express generally pleasant and unpleasant emotions by the simulation of muscle tensions and contracted or expanded states; and, possibly, it may express natural specific attitudes toward, or feelings about, various objects of interest should it be possible to discover principles of posture and movement that normally accompany these attitudes and feelings in life situations.

This last problem will be an important subject of discussion for the chapter on the contribution of dance to the meaning of movement. George Buswayer expresses the need strongly when he writes that the dance's challenge to acting today is to break through the wall that separates passion and gesture, emotion and motion, in order to create gesture from within.[104] His challenge is to make the inner feeling dynamically and truthfully manifest.

So movement and its qualities provide expression of a wide range of meanings, according to our texts, that include the most general up to the most specific possible

---

[104]Gassner, op. cit., p. 478.

until the direct designation by verbal symbols pins the meaning to a particular.

CHAPTER V

AUDIENCE RECEPTION OF MOVEMENT EXPRESSION

A. Introduction: Problems and Area of Interest

To complete the full process of the meaning of movement it is necessary to take at least a brief look at the audience as the recipient of the meaning, according to the authors of directing texts studied. A director, to be successful, must consider not only the meaning he feels he is expressing but the meaning that the audience is actually receiving. To do this he should know something of the processes of reception; he needs to know what are the limitations as well as the possibilities. The nature of the senses and the learning processes, the differences between a single viewer and a mass audience, the aesthetic and psychical relationships that exist between audiences and productions, the audience predispositions, and the audience's conventional expectations should all be a part of his knowledge. However, because this facet of the meaning of movement is really more the subject of audience psychology and of communication theory than of expressed meaning, it will only be touched on briefly; yet this facet is vital as the end product of the communication process, and must be included. Unfortunately, results of specific testing in this area are

st
v:
s
a
a

c

still somewhat inconclusive and fragmentary, with opposite views being held by authorities in certain fields. There is still great room for the testing of just what is received by an audience when something is expressed in movement by an artist.

There are related fields interconnecting with "meaning" of movement for an audience that are difficult to separate from the central subject under investigation; such subjects as the values of a play, the teaching potential, the degree of effect it has upon behavior, or simply the stirring-up of emotion by direct empathy are all peripheral investigations; however, to some extent they are considered here as they may influence the actual reception of meaning by an audience.

B. Communication as the End Product of Dramatic Expression

Much has already been mentioned about how an audience is supposed to receive impressions and how it is expected to react. Now this study is concerned with theatre that exists as a communication media with the end product that consists in values to the audience. Theatre whose purpose is primarily therapy or education for the performers is an inept vehicle for communication. The playwright, director, designer, producer, and actors are paid in professional theatre because they combine to bring value to the audience. If they cease to produce value for an audience, they cease

to perform. Training or therapy put aside communication seems to be the only warranted purpose for expression.

It seems further that art is a designed product, and, in the case of theatre, is expression designed to communicate itself to a mass audience. Theatre art is successful to the extent that each designed expression in fact is communicated to an audience. This study maintains that mass communication that is supposed to mean anything to anybody, that is, nothing specific to the entire audience, is really a failure to design or is an artist's personal catharsis. Such a production appears to be the result of abdication of the artist from his function of communicator; since so much is known about designing his movement and production he ought to be able to stimulate the effect he desires.

Expression that is supposed to be the result of how the individual expressor feels, regardless of who receives his feeling, seems at the other extreme from art. The esoteric production is private, selfish, and unsuited to the mass media. With a time-space art, the esoteric production seems completely futile. Unlike the painting, the play cannot remain in museums until it is appreciated by some future audience; esoteric communication in theatre is really no communication at all, not even potential.

C. How Individuals and Mass Audiences Perceive

Perhaps two audience divisions would be helpful in audience reception study: First, the psychological, or perceptive, nature of the individual, and second, the special nature of people who congregate in a theatre to watch a production.

1. How Movement is Perceived and Interpreted Generally

The authors, represented by Dean, have already proclaimed that people are more impressed by sight than hearing, and more impressed by moving than stationary objects or people.[1] These statements lay the groundwork for the relative strength of impressions received by audiences from words, still picture, and movement. In essence the director knows he has an instrument in movement that can easily overbalance or even obliterate the impression gained by almost any other means of expression, if Dean is correct. Dean bases this power on the audience's mental and bodily conformity to the impressions received from the stage.[2]

In other terms, Selden proclaims that man is a pulsating, singing, dancing, emotional being.[3] Dance, music, and rhythm are inherently stimulating because of man's, what might be called above, cultural nature and from his inherently rhythmic nature.[4]

[1]Dean, op. cit., p. 297.   [2]Ibid., p. 284.

[3]Selden, op. cit., pp. 18,34,41.   [4]Ibid., p. 48.

Of course, there is a step missing in Selden's reasoning. It is one thing to say man is inherently a rhythmic animal; another to say he enjoys theatre because it is rhythmic. Does theater's expression of rhythm, or other elements, communicate itself to an audience, and if so is it positive (pleasurable), and if so, how, and to what extent? The differentiation is important because of the nature of Selden's evidence. He draws upon history, anthropology, and observation to show, quite completely for most purposes, that man everywhere, sings, dances, and feels. But this is in man's function as performer, or participant; man is exercising his own body and emotions. Does he enjoy the witnessing of someone else doing the same? The **prima** _facie_ evidence is that he does. Spectators are available in droves to testify to the fact; however, what attracts them to one expression and turns them away from another still needs investigation.

In general, Selden suggests several "hows" and "whats." He states that a musical expression of emotion stirs the same emotion in the listeners; in fact, that the same emotion which impelled a vocalist to sing is felt by his audience.[5] His statement has doubtful validity. That some emotion is carried over seems plain; that the singer, or actor, or other artist, must feel anything at the time of performance, or that what he feels is what he conveys, is

---

[5]_Ibid_., p. 38.

very doubtful. It is even more doubtful that an audience can, does, or cares to, distinguish between an accurate portrayal of the symbols and symptoms of emotion and the real emotion. In fact, the real emotion, as has already been pointed out by both Selden and Dietrich, is usually too unspecified and symptomatically small to even reach the audience clearly.

a) <u>The Nature of Empathy as a Communication Mechanism.</u>-- The point here is to investigate the process of direct communication of emotions to see what is received from what expression. This process Selden and others refer to as empathy, or the empathic motor response, and is general- ized by Selden into a concept of "feeling into" the performance.[6] This "feeling into" objects, either moving or stationary, seems to involve a combination of perception and participation.[7] This empathic response produces both incipient and overt muscular tensions and relaxations in the observer in some direct relationship to the object observed; greater (more overt) participation occurs with moving characters than with still objects.[8] In order to "feel into" an object there seem to be two requirements: first, that the object is presented to our senses; i.e., as Dietrich points out, the audience is only affected by what it can actually perceive;[9] and second, as Selden and Dolman point out, the objects must somehow be a part of the

---

[6]<u>Ibid.</u>, p. 298.   [7]<u>Ibid.</u>, p. 289.   [8]<u>Ibid.</u>, p. 290.
[9]Dietrich, <u>op</u>. <u>cit.</u>, p. 8.

previous experience of the perceiver.[10] It is noted that there does not seem to be any necessity for the exact object to be a part of the perceiver's experience. The formal qualities of the object, drawn from a metaphor, or merely the similarities of the object to one in the audience's experience, are sufficient to allow for participation in that object.

Dolman adds that the motor responses to movement occur in empathy whether or not the perceiver has experience of the object, but that his responses have no meaning without prior experience either of the object or of the particular motor responses.[11]

b) How Empathy May Communicate.--On the surface, at least, both Selden's and Dolman's views seem to depend to some extent upon what Dolman describes as the James-Lange theory of emotions.[12] In brief, it is that a motor response in a perceiver sets up an emotion in the perceiver rather than an emotion setting up a motor response. Gassner proclaims that the James-Lange theory is outmoded, in connection with certain remarks about it and modern acting.[13] In any event, it seems that perceiving tension-relaxation relationships, either implied or actual, will set up similar

---

[10]Selden, op. cit., p. 298; Dolman, op. cit., p. 11.

[11]Dolman, ibid.

[12]Ibid., p. 103.

[13]Gassner, op. cit., p. 140.

patterns in an individual. It is not for this study to decide whether a felt emotion precedes and causes the motor response, or whether a motor response precedes and causes a felt emotion; it is quite conceivable that the process is to some extent reversible. If it is, then the results for theatre are quite important. Accurate choice of rhythms, compositions, and movements could then produce a tension-relaxation pattern in a spectator that could make him feel quite closely what the director desired. If the process only works the one way, that observable connotations alone, a mental process, result in physical audience symptoms, then there can be less uniformity in reaction. The individual backgrounds of the audience come more into play; however, this needn't impede the process if the director succeeds in expressing a symptom or symbol that is generally known to his entire audience.

At any rate, it seems that motor responses are set up in people from observing objects that imply or express tensions and relaxations. Such empathy is the psychological tool for the communication of movement expression.

c) How Specific Empathic Communication May Be.--The specificity of communication seems to depend on the specificity of symptoms and symbols. If there are specific symptoms, body tensions, and observable characteristics for emotions and attitudes then empathic response should be able to receive them specifically.

Some comment has already been made in an earlier
section concerning Dietrich's view about the difficulty of
expressing different emotions in a natural way. Gassner
supports the view in saying that the same bodily responses
are named differently by audiences depending upon the
situation in which they occur.[14] In other words, general
emotional symptoms and physical gesture (in Smith's sense)
are interpreted differently depending upon the context in
which they occur. Gassner, more than Dietrich, tends to
draw the conclusion from this that there are no specific
body movement symptoms with which to identify specific
emotions. His purpose is to suggest the elimination of
conventional attitudinizing in acting.[15]

What Gassner fails to point out is that there may be
a middle ground. Recognition of symptoms in a context may
not be a fair test. He doesn't give any details concerning
the kinds of emotions named. Dietrich's designation of
pleasant and unpleasant emotion, for instance, is more
specific than mere generalized emotion. Different audience
interpretations may have grouped themselves under these
headings without all naming the same word. Further, there
is a power in words not primarily the concern of this paper.
Should accurate symptoms of anger, for instance, appear
while the situation seems appropriate to fear, and the words

---

[14]Ibid., p. 140.   [15]Ibid.

designate the feeling as fear, the audience is apt to interpret the emotion as fear. The problem needs more investigation than has been made by the author's chosen. Nor do still pictures of facial expressions as tested by John Tolch[16] suffice for empathy. Without complete body response, in motion, under controlled circumstances, there is no fair appraisal possible.

An interesting observation concerning Gassner's view is that he runs into difficulty in applying his theory to his method. If the actor is supposed to draw upon his own experience in order for the details of emotion to ring true, how can the actor achieve this specific goal if specific qualities of emotion are not communicable? After all, the consensus seems to be that the inner is of no importance if it does not take on an outer form.

The above discussion serves to compile the directing authors' views on how movement is perceived and interpreted generally. It certainly should point up some of the ways the psychologist may help the director to get more detailed answers.

2. How Movement is Perceived and Interpreted by The Theatre Audience

What happens to individuals, to their empathy, to their perceptions, and to their emotions when they voluntarily become a part of an audience is a special problem. Certain predispositions and expectancies begin to influence how and what they receive.

a) _Predisposition to Unanimous Reaction_.--Hopkins says that the theatre is seeking, and the audience is receptive to, a unanimous reaction;[17] to get this the play and the director must appeal to the unconscious; the emotional re-action must be secured first. Eventually thought may arise out of emotion; Selden agrees.[18] An intellectual discussion, Hopkins claims, will only divide an audience up into individuals without convincing them of the validity of any presented argument.

Selden adds that an audience comes to a theatre set for an active response, ready for empathic feeling, ready to enjoy vicariously more than it ever can in its own several lives.[19] The audience wants to participate, not merely to perceive. In another place Selden says that the audience comes with the desire to quicken its sense of living; it has to live vicariously because its ambition exceeds its energy.[20] Max Reinhardt suggests that in some sense an

[17]Hopkins, _op_. _cit_., p. 8.

[18]Selden, _op_. _cit_., p. 320.   [19]_Ibid_., p. 289

[20]_Ibid_., p. 135.

audience comes to the theatre to be "made one" with the
play or with some character, to become part of the whole, in
a sense to act as part of a chorus.[21]

b) <u>Predisposition to Aesthetic or Psychical Distance</u>.--
There is a question, however, about the degree of identifi-
cation the audience may desire. The audience may also come
to the theatre to be "distanced participants" and involved
aesthetically but not practically.

Dolman, in his discussion of aesthetic distance, suggests
that an audience may come with the purpose of being a
spectator at a fictional event.[22] From his writings, and
other works on the subject, it seems that an audience is pre-
disposed to be entertained, to enjoy as a group, but to
agree that what is happening on stage is unreal. Aesthetic
or psychical distance seems to be imposed upon a production
by common audience consent when it enters a theatre. The
implications of this predisposition are far reaching. With
such a predisposition, the audience can be swayed emotion-
ally, empathically, or vicariously, in a sort of cathartic
or exercise fashion, but the possibilities of the audience's
being influenced, of their relating the emotions or content
to the audience's practical lives, become slight.

The point here is that audience predisposition is apt
to determine what it is they hear, see, feel, and think. If

---

[21]MacGowan, <u>op</u>. <u>cit</u>., p. 163.

[22]Dolman, <u>op</u>. <u>cit</u>., p. 15.

the audience comes to enjoy vicariously, given any support from the stage it will do so. If it does not come to be taught it might be difficult, or even impossible, to teach it. The closer a play may approach affecting the personal lives of the audience, the more the audience may adjust to maintain the predisposed psychical or aesthetic distance.

c) Predisposition to Accept Conventions.--It seems that another predisposition of the audience is to enter into the conventions of the theatre and of the particular play presented. This in practice may be the audience predisposition to hunt for, and to find, symbols, metaphors, and psychological motivation, as well as to "read the language" of the compositions in color, form, rhythm, and other abstract meanings. If the director is at all clear or consistent, the audience usually matches his efforts with its predisposition. Just how much it is able to decipher metaphor and symbol will of course depend upon how well the director has chosen from the common cultural and natural background. As Colby Lewis reports of Jessner, his symbols ultimately require the intuition of the audience.[23]

The dangers of metaphors and symbols are of course; first, that they may be so obvious that they insult the intelligence of the audience, as apparently Jessner's critics felt his did, or, second, that they are so remote from the audience's experience that the audience reads into the symbol

---

[23]Lewis, op. cit., p. 205.

a wide variety of meanings, depending on its individual back-
grounds, and perhaps misses the director's intent.

A third danger of symbol in context is that of needless
repetition. The symbol may be redundant by only repeating
what the context already makes clear. The subtle balance
has to be judged by the experience of each director, to make
a movement metaphor add a unique quality to a scene without
its being obvious, esoteric, or redundant.

The audience reception of the meaning of movement, then,
seems to derive from these three sources: a basic empathic
response to the simulation of psychological behavior, an
apprehension of a metaphorical relationship between the
movement and something else in the audience's experience, and
an apprehension of certain accepted conventions and symbols
whose meanings derive from the audience's culture in
general and from the theatre in particular.

D. Conclusion: A Challenge to Take Advantage of Audience
   Predispositions and to Expand the Meanings of Movement

If a director seeks to change audience behavior through
theatre movement he may encounter strong opposing pre-
dispositions; however, if he wishes to please his audience
then the predispositions all seem to be in his favor.
Further, the audience's large capacity and strong desire for
enjoyment, feeling, and understanding seem capable of further
expansion. It remains for the director to use the resources
at his disposal and to uncover additional sources to enrich

his movement meaning so he may try to satisfy the audience's expectations and capacities.

The next step this study will take to expand the director's repetoire of movement meanings will move beyond the directing authorities and into related media. Aided by psychology, the disciplines of pantomime, dance, and motion picture can all enhance the director's mimetic principles, theatrical conventions, and cultural metaphors. And as long as he takes advantage of, rather than opposing, his audience's predispositions he can expect assistance from it in many ways to make his task easier.

PART II

NORMS OF MOVEMENT MEANING EXPANDED

BY COMPARISON WITH RELATED SOURCES

CHAPTER VI

SCREEN PRINCIPLES AND TECHNIQUES ADAPTED
TO STAGE MOVEMENT AND PICTURE

A. Introduction: Relating Theatre Movement to Screen Arts.

In relating stage movement to screen movement, it is useful to group both motion picture film and television under the single category "screen", especially when what is being discussed is in common to both. When referring to what is unique in each media the terms "film" and "live television" will be used. Since television can use almost anything that can be placed on film, and live television can avail itself of camera movement, subject movement, and the apparent movement of editing, the one designation that seems most appropriate for the purposes of this chapter is screen, with a sub-category of live television only necessary in order to consider special relationships between the audience and the live performance. It is true that the size and reactions of audiences may differ between the film and television media, but presumably the screen products differ only to the extent that television can use improvement in clarity and size of picture.

1. Interdependency of Stage and Screen

The screen certainly follows the stage production in historical time, and presumably to some extent uses

techniques derived from the stage.

Theorists have two general tendencies in relating theatre to the screen. One is to point out the late comer's dependency on its predecessor while the second is to defend the later medium on the grounds of its unique characteristics. Undoubtedly film and television owe a great deal in both content and technique to theatre. And certainly all the arts are based on certain common abstract compositional principles, but the special techniques of the stage seem particularly adaptable to the screen. On the other hand, screen production methods, ways in which the audience views the screen, and the versatility of the camera have resulted in unique characteristics of the screen portrayal that are not derived from the stage, and perhaps are peculiarly adaptable to the stage.

2. Purpose of Adapting Screen Movement to the Stage

The purpose of this study is to take some principal concepts and specific techniques that make the screen unique and to apply them to the stage, thereby reversing the usual process. Why should this application be made? First, it seems fairly obvious that the screen image, in some form, is reaching a tremendous number of people; its popularity is ever increasing. Second, after nearly half a century of motion picture images and over a decade of television images, the screen has developed its own aesthetic and technique to the point of a mature art. Its

popularity and its maturity suggest that perhaps the stage can now profitably borrow some of the hard learned lessons of the screen, even as the screen originally borrowed from the stage. Of course whether or not the borrowing of techniques is good will depend upon whether or not they prove useful and fruitful.

3. Kinds of Screen Movement That May Be Adapted

In broad categories, movement on the screen seems to be of two kinds: Real and apparent. Real movement is that of the subject or the camera. Apparent movement is that of either editing or animation. These last two are called apparent because the movement is only suggested; in editing, the change of content from one frame to another may suggest that the subject is moving or at least is changing, or accumulating, meanings; while in animation, a sequence of drawn, still pictures, in sequential poses, photographed in sequence, gives the impression of movement. Together these categories seem to account for all the real and apparent screen movement.

Generally the stage only avails itself of one of the screen's possibilities for movement: the movement of the subject when that subject is a live actor. The screen can also portray the movement of inanimate objects with equal facility, with either real or apparent motion. To be sure, the stage cannot literally adopt most of the screen principles without becoming the screen art itself; however,

there are several ways in which the imaginative stage
director can adapt screen movement to his purposes. He
can accomplish much on the stage that camera, subject, and
editing movement can on the screen.

4. Methods of Adapting Screen Movement to The Stage

The stage director may adapt screen movement to the
stage either directly or indirectly. The first method is
to use the specific screen technique directly on the stage;
the second is to use the concept, or principle, of the move-
ment, or to borrow what the screen movement has accomplished,
and to incorporate that into the stage movement. The latter
course uses either analogy, the substitution of analogous
parts, or abstraction, the borrowing of a principle while
clothing that principle in a different concrete application.

Both specific techniques and movement concepts of the
screen may be divided into two categories: those that are
held in common with other arts and those that are unique to
the screen. It is with the latter category that this
chapter is chiefly concerned.

In this chapter attention is called to the special
role of the camera and to what it can produce by way of
shots and montages, but also to what it can produce by way
of audience identification and point of view. Of concern
will be the screen's place in the continua of immediacy and
spontaneity, and how these qualities may be adapted to the
stage. Also of special interest will be the special filmic

relationships between sight and sound as they apply to stage movement.

In his method, the stage director may take from any screen element its purpose, its form, its movement principle, its visual impression, or some aspect of its internal relationship. He may use so many of these elements that a screen technique is transferred almost intact to the stage or he may use the screen form with an entirely new purpose, or the same or similar screen purpose embodied in a different stage form.

As each concept or technique is discussed, a method of abstraction will be employed to help adapt it to the stage. Then a specific way in which the screen idea can work for the stage will be suggested. It is not intended that such a method will be exhaustive but merely suggestive of the ways in which one moving medium may stimulate ideas for movement meaning in another moving medium. However, the specific application of principles, in the form of examples, will be a vital part of the process.

B. Screen Techniques Adapted to the stage:
Individual Shots and Sequences of Shots

The motion picture is composed of individual shots that are edited together into sequences. According to this study, a shot is any strip of film that is exposed consecutively, without a splice in it, or any television image that is viewed by one camera consecutively without a break. A group

of such shots, spliced together, or electronically joined
together, constitutes a sequence. Sequences are formed in
order to produce some cumulative effect that cannot be
obtained by any one shot alone. And since such a cumula-
tive effect is largely in the domain of the montage this
study will refer to any such sequence as a montage, even
though some editors restrict the use of montage to certain
types of sequences. The individual shots in a montage may
partake of two kinds of movement, camera and subject, while
the apparent movement of editing is restricted to the
montage. The apparent movement of animation is really the
art of still photography made to look like movement and is
really not concerned with the shot or the montage as
described above.

The possibilities for movement meaning within in-
dividual shots and because of the way individual shots are
spliced together are of primary interest to this study.

1. Individual Shots Adapted to the Stage

a) Shots Defined, Varieties and Labels.--Individual
shots have special pecularities in the film apart from
their inclusion in a montage. Many of these peculiarities
can suggest movement possibilities to the stage director.
Among the more common types of shots are those in which
the camera is in motion; shots which get their names from
their dominant movement characteristic. They are the pan,
the tilt, the dolly in, the dolly out, the elevator, and

the zoom. Other shots are those in which the actor is in motion, where he may move toward, away from, or across the camera. Other shots are identified by the composition of the material in the shot such as a two shot, a shot of two actors. Some shots deal with the amount of material shown in the frame because of camera distance to the subject. These are the long shot, medium shot, close up, and various variations of these. Of course, any particular shot may involve elements from each classification, such as a panned long shot of two walking characters that dollys in to a close-up.

Other shots are identified by the speed or point of view of the camera. More frames exposed per second with a normal projection speed results in slow motion. Fewer frames exposed per second results in speeded up action on the screen. Shot from a low angle or point of view, an object seems to loom in height because of foreshortening in perspective. Shot from above, an object seems to lose strength or significance.

Of course there are numerous other variations possible for the single shot, including, for example, the effects of different lenses; however, the stage parallels to be drawn are of greater importance to this study than an inclusive list of shots.

b) <u>Function of the Shots</u>.--Perhaps the greatest aesthetic importance of the screen is its ability to control the audience's attention and its manipulation of time and

space. Each shot mentioned involves some way in which the director composes in a frame exactly what he wishes his audience to see, in the order in which he wishes it seen, and in the space relationships he chooses. This ability to manipulate time and space is of course augmented by the montage, but even the single shot has much potential. If a stage director could in any way approximate this manipulation of time and space so that he could more closely determine what an audience will look at and what he will feel about what he sees at any particular moment, his control of his art medium and his audience would certainly be increased. How then can these shots suggest stage movement to the director who is interested in similar control of time, space and audience? A few samples are in order.

c) <u>Sample of Shots Adapted to Stage Use</u>.--This study will use three basic examples of the adaptation of screen shots to the stage. The pan, involving the moving camera; the long, medium, and close-up shots, involving distance from the camera; and the slow and fast motion shots, involving the speed of the camera.

1-Moving Camera: The Pan Shot. The pan, or panorama, shot usually consists of a slow sweeping view that moves in the plane of the horizontal. Of course the speed can be increased all the way to a swish, or blur pan that renders all but the beginning and end of the shot unrecognizable. One of the purposes of the slow pan is to reveal a wide subject

gradually, much as a man might sweep the horizon with his eyes. Another purpose is to provide a connection and transition between two objects that are at either end of the shot. The point is that the screen audience is compelled to see the horizontally arranged objects in the pan in the order the director presents them, culminating with a subject in focus at the end of the pan.

Applied to the stage, the pan may help to compel a serial order of audience perception. In the theatre the audience may look around the stage in various patterns and sequences that may not develop the director's or playwright's idea nearly so well as some one way of looking, such as in the gradual revelation of the pan. In adapting the pan, by analogy, the director's ingenuity in selecting and switching analogous parts often can result in ingenious new ways of looking at his subject matter and controlling his audiences.

One set of analogous parts in the pan shot is as follows: let the camera take the position of the audience's eyes; let the arbitrary cutting off of material by the frame be the control of the director; let the object at the beginning of the pan be an actor in focus at stage right and an actor at the end of the pan be the object in focus on stage left. Between these two actors there is a group of people; the director wants to emphasize each person in the group briefly and in sequence. All the parts of the

analogy match with no difficulty except the enforced moving frame. Here is where the director's ingenuity and knowledge of stage composition help to complete the analogy.

From previous discussions this study has arrived at certain opinions: on stage a moving object gets more attention than a still one, the direction in which actors look tends to be the direction in which an audience looks, the center of a composition tends to be in focus, and an isolated or different object tends to be in focus. These principles of composition substitute for the camera's ability to enforce a focus. The final problem for the director is to shift his focus gradually across the stage to conclude with a stationary focus on stage left.

Of course the purposes of the script come before the pan, but without a knowledge of the screen technique a film director might not see the possibilities of interpreting a particular script purpose into a screen derived movement pattern, such as the pan. The important new element in these examples is that they combine the purpose of the pan, learned from the camera, with the principles of composition, learned from the still picture, into a moving composition that shifts the focus gradually as would a pan.

The basic element in the moving focus is the moving object on which to center attention. An actor may move from right to left across the stage, or an object may be passed from actor to actor. The moving element may be more

subtle; that is, the conversation may pass from right to left without any physical object passing. A moving object may pass across a relatively static grouping, thus emphasizing its movement and keeping greater focus.

While the object is moving the additional problem is to focus on each man it passes in turn. For example, if a photo is being passed, and each man makes a comment as the photo reaches him, both the moving object and the new speaker will help to move the focus, and to emphasize in turn each new speaker. If the eyes of the group travel with the paper and to the new speaker another element enforces focus. Should there be a subtle grouping change to make each new character the apex of a small composition, or else to put him in slight isolation, then further enforcement of focus takes place. The result is a wave of subtly changing compositions to carry the focus across the stage in simulation of a pan and fulfilling the purpose of a pan.

Of course it is not expected that this particular example will occur very often on stage; however, the opportunities to use the method of adaptation of the moving shot will depend only upon the director's ability to see moving parallels in his script.

2-Distance of Camera to Subject: The Long, Medium, and Close-up shots. The screen director has at his disposal a movable point of view. He can get at any distance from his

subject he desires, either by changing lenses or by moving his camera. The basic varieties of these shots, according to the distance of camera to subject, are called the long, the medium, and the close-up shots.

One main advantage to the camera's ability to change distance is the increased amount of control the director has concerning how much context will appear around his subject. The long shot shows the total context in which a subject appears, the medium shot a smaller context, and the close-up can eliminate the context and show only the subject. The stage director can do this to some extent by eliminating excess scenery, properties, or distractions, but he cannot eliminate the scenery or other actors as completely from the stage, as can the film director in the close-up, which allows for intense concentration on a detail. The stage director is usually confined to one continual long shot with his total context always showing. How may he accomplish the purpose of the close-up, that of concentration on one small area at a time? First it seems necessary to try to find out how the screen close-up functions in relation to the longer shots and to its stage counterparts.

The screen director has discovered certain basic qualities of the various size shots at his disposal. First, the less meaningful material there is in the shot, the shorter attention is held; conversely, the more meaningful material there is in a shot the longer attention is held,

although the attention is apt to be looser, more diverse, or
scattered, and hence less controlled, than in the close-up.

Of course, the movement of a camera into a close-up is
not to be equated with the diminishing of meaningful material,
although there would appear to be some positive relationship.
The closer the camera, the more context is eliminated, but
the more detailed and the more complex becomes the subject
itself. However, supposedly the subject has gained at least
part of its meaning from its relationship to the larger
context from which it was extracted, and hence tends to have
less meaningful material than a more distant shot, even
though the close-up may give a very intense statement of its
lesser meaning. For this reason, the screen director must
learn not to hold his close-ups too long at the risk of
irritating or boring his audience.

The stage director, not having the advantage of making
more detail apparent, because of the immobility of his live
audience point of view, and not being able wholly to
eliminate a context for his subject, must be even more
careful about how long he attempts to maintain a close
view. On the stage more than a few seconds concentration of
a face, a hand held prop, or a hand gesture will probably
cause the audience eye to wander through the total stage
context uncontrolled by the director.

Learning from the screen close-up, however, the stage
director may gain longer concentration on a portion of a

composition by having that portion more complex than its

context, more meaningful in the relationship of its details,

and more moving and changing in those internal relationships.

Such additional meaningful details and changing relationships

should maintain audience attention on a small area for

longer than seems possible on a more static and simple

subject.

3-Combination of the Pan with the Long,Medium, and Close-up

shots. Here is one way in which screen shots may be combined

to provide additional material for stage movement. The

director may use three variants on the stage pan: the panned

long shot, the panned medium shot, and the panned close-up.

In the panned long shot, there is perhaps a group of smaller

groups of people standing around the stage in animated dis-

cussion, sipping cocktails; the chief character on stage

right is served a cocktail by a waiter. He thanks the

waiter, drawing some slight new attention to himself. The

waiter weaves across the stage to the left, serving cock-

tails as he goes. Each new character acknowledges the

drink and has something to say, but fundamentally the entire

stage is a moving composition with the audience eye casually

sweeping the stage, carried by the movement of the waiter.

One way of accomplishing a pan in a medium shot would

be for the chief actor, rather than a mere waiter, to move,

carrying the focus with him. Each place he goes a new small

composition forms around him, reacts to him, and dissolves

around him as he moves into a new small composition.

Relatively static characters, predominance of backs of
actors, and slow motion movement, will de-emphasize the areas
outside the focus while greater animation, more faces and
voices and a downstage isolated composition will tend to
keep the entire little moving composition in focus, unlike
the long shot where the entire stage is relatively active.

The passed document is a good example of how to
achieve a close-up pan. Attention is directed to the hands
and face of the person viewing the passing object. The
object itself, for this purpose, would only be seen by the
viewer, other actors would be relatively static, and the
lower parts of actor's bodies would be relatively stationary
so as not to distract from the head and hands. Those
actors in the periphery could even be blocked with their
backs to the audience.

The role of the close-up and long shot and of the
moving camera adapted to the stage is then only a matter of
the ingenuity of the director and his ability to see script
purposes served thereby. He can even add new dimensions to
the same shots. There can be achieved a fast pan that
resembles a wave of activity peaking across the stage, a
blur pan that hurls the audience attention across the stage
by a sudden movement of heads and bodies to set new lines
of focus, or the combination of waves of movement with
sudden concentration on a single moving object at the end
of the pan. A pan might be used that employs other line

patterns of composition and, for example, zig zags across the
stage ending up in the down center position, or snakes, lead-
ing the eye around the stage in swivels, and ends in the
remote but important up center position. The combinations
for application are unlimited once the purpose of the camera
movement is discovered, the pattern of the total scene in
focus is determined, and the concept of manipulating the
audience's attention in size, shape, and direction is seen.
4-Speed of Camera: Slow and Fast Motion Shot. The camera
shot can be characterized by lengthening or shortening on
screen the time actually taken by a subject to move; such
shots would be slow or fast motion. One purpose of slow
and fast motion that this study will use as an example is
the purpose of making actual time fit closer to psychological
time, i.e., closer to interest span than to realistic time.

If all the details of a movement are important, or the
lengthening of a movement may create desired suspense or
languor, the camera extends this movement in time. In real
life, efficient business and excited reactions tend to be too
rapid and too small to be effective on stage; an adaptation
of slow motion, that includes increase in size as well as in
time, may increase stage effectiveness. For example, a man
on stage is about to steal money from a safe. For suspense,
the safe opening is extended in time. Movements are larger,
slower, and more firmly planted than in real life. Each
movement is defined with a beginning, middle, and end. In
other words, each move of the hand on the safe is phrased,

without overlapping into another movement, one move at a time.

If the details are not important, if group rather than individual reaction is important, or a feeling of excitement is required then a speeded up action may be used. Actual speeding of movement, judicious cutting of pauses (such as shock reactions and hesitations), simplification of movement, and overlapping of movement can all result in less time consumed and in the appearance of greater speed.

One specific fast motion screen effect was achieved on stage in New Girl in Town. The effect desired was that of the silent film going through a more modern high speed projector resulting in the familiar speeded-up-action sequence. The effect was created with a rotating mask over a high powered spotlight that alternately revealed and concealed the stage action in a flickering light. The blacking out of bits of action on stage actually approximated the effect of cutting out, or of substituting black for, every other frame in a motion picture film. The single spot beam also simulated the beam from a motion picture projector. Since the stage action was a rapid dance sequence the effect very closely resembled the desired filmic shortcoming and hence made direct use of a screen device.

The further use of screen shots for stage purposes is limited only by the director's analogical imagination and script insight.

2. Sequences of Shots Adapted to the Stage

a) <u>Montage as it is Used on Screen</u>.--The screen's manipulation of time and space concerns the montage even more than the single shot. The screen not only manipulates attention, time, and space by the shots presented but also by order in which they are presented and the way in which they are joined.

1-The Three Types of Screen Montage. The order of shot sequences fits into three categories defined by this study as three types of montage. They will be called here the continuous, the simultaneous, and the cumulative. There are many more designations possible but these three are selected as representative.

The continuous montage is a sequence whereby each shot matches with its predecessor and its successor to form the impression of a single continuous action. One of the chief exponents of this type is the succession from long shot to medium shot to close-up where each succeeding shot contains part of the content of the previous shot and each follows in time from the previous shot. Another common example is where the subject moves out of the frame at the end of one shot and moves into frame in the beginning of the next.

The simultaneous montage is a sequence whereby different actions are occurring at the same time but pictured alternately. A typical example of this type is the chase wherein the shots of the chaser alternate with shots of the chased. The

simultaneous montage need not, however, involve actions wherein both parties are aware of each other merely wherein it is obvious that both actions are happening at the same time.

The third or cumulative type perhaps overlaps somewhat with the second and comes in many varieties. One variety is the dialectical: the first shot in a sequence states a thesis, the second an antithesis, and the third shot is either omitted, leaving the audience to draw a synthesis, or the third shot is included to synthesize the first two. The simultaneous montage overlaps the dialectical because in both types the audience draws a conclusion from the juxtaposed shots. A man running and looking back cut with a man running and looking ahead, determine the conclusion, or synthesis, that the former is being chased by the latter.

Another version of the cumulative montage and the most commonly called "montage" is one in which a whole series of pictures add up to a single concept, such as "war is hell." An explosion, an infantry charge, a cannon shot, a falling soldier, a dead man, a tank, a barbed wire entanglement, and so on, combined with appropriate sounds, have a cumulative effect. They not only show a total context, usually drawing attention to more universal characteristics of the individual situation of the film, they also show a point of view toward both the context and the smaller situation.

2-Method of Joining Shots in a Montage. The ways in which the shots in a montage are connected also come in for some consideration. The cut, wipe, dissolve, and fade are the usual methods. In the cut there is an immediate jump to the new picture; in the wipe an edge shape crosses the screen wiping out the old picture and wiping in the new. In the dissolve, one image becomes weaker and fades out while another fades in to replace it. In the fade out, usually the picture dissolves to black; in the fade in the black is replaced by another picture dissolving in.

    b) Purpose of Screen Montage Adapted to the Stage.-- Certain special effects, purposes, and properties of the montages, and the methods of connecting the shots in the montage, hold special interest for this study. The larger principle involved is the ability of the film to juxtapose ideas in order to draw attention to special relationships they have to each other. Certain pictures of actions or of subject matter not only express certain ideas and feelings about those ideas by their form and content, but they can be compared or contrasted in idea, form, and content immediately with other pictures through the immediate replacement of one picture with another on the screen. One example is chosen from each type of montage and each type of joining to see how it is possible to use these screen principles on the stage.
1- Shot Joinings Applied to the Stage: Fade, Dissolve, Wipe, Cut. The joinings are simplest and hence taken first. The fade out and the act curtain or the black out are approximately

equivalent in meaning and effect. They all cut off the action either gradually or quickly and do not replace the action with another action until the first is completely eliminated. They all have the effect of suggesting a passage of time and of ending a large playing unit such as an act, a scene, or a series of sequences.

In both stage and screen, once the fade out or curtain, has occurred the symbol for a change is complete. Actual time need not pass for the audience to accept the idea of passage.

The one accomplishment the screen blackout has that surpasses the stage blackout, or curtain, usually is its ability to fade in again immediately with an entirely new location. The pace of stage movement can be immeasurably increased with the attempt to emulate the films easy and speedy transition. At present the theatre already employs re-volving and wagon stages, or moving wings and drops, to change locations with speed. A budget solution to the same device is the multiple stage where one area blacks out and another is lit. Other solutions are the unit setting, back-drop projection, and the abstract setting. Each in its own way can change location with almost as much rapidity as the film fade out and can symbolize the same time and space change. The theatre, then, it seems already has sufficient equivalent for the fade out.

The dissolve most commonly reflects a passage of time

that is somewhat less than that of the fade. The passage
may also involve a change of location and a change of mood.
In stage terms the dissolve would be appropriate for the
connecting of two French scenes, a paragraph change. However,
the dissolve has special uses that make it more interesting
to adapt to the stage. Because of its nature, the dissolve
passes through a phase wherein two pictures are temporarily
superimposed. The superimposition allows for a comparison
or a contrast between the contents or the shapes or the
movement of the two shots whether or not the director wants
that comparison. If the comparison is used the transition
is usually called a matched dissolve.

The matched dissolve says, in effect, this shape is
like that shape. By analogy the audience draws an inference.
If this shape is like that shape, then this subject is like
that subject, this activity is like that activity, this man
is like that man, or this motive is like that motive. In
short, the superficial resemblance becomes symbolic of a
deeper resemblance. The problem becomes one of the director's
ingenuity on stage to juxtapose superficial resemblances
close enough to each other for the audience to get the
suggestion that deeper relationships also exist. There
are several ways this may be accomplished.

The first approach to adapting the associational
purposes of the dissolve to the stage is the literal, the
attempt to juxtapose images on stage in both time and space.

For this method a scrimm curtain can be employed such that
a person actually does fade out while another replaces him
in front of the curtain at the same location. Unless
carefully used, however, the scrimm attracts more attention
to the trick than to the comparison. A dissolve in space
but not in time, that might be called a matched fade out-
fade in, is possible with less distraction. A fade out
occurs and during the darkness another character replaces
the first.

Such a dissolve replacement can have several kinds
of meanings. If first the father is in his favorite chair,
reading the newspaper, and then the son, the mother, a tramp,
or the butler is in the chair there is the obvious suggestion
that a new person has replaced the father in his role of
authority and prestige--either comically or seriously. If
the new figure is engaged in the same typical activity
as the old figure, the suggestion is that the new person
has the same personality and character traits as the old.
Conversely, a matched fade where there is a contrasting
element says strongly that there is one way, at least, in
which these two characters are quite different. There
have been some changes made. Usurping has taken place
but with a difference.

A similar matched purpose can be achieved with a slight
change in both time and space. If there is a split stage,
a multiple setting, such as in the two rooms in Voice of the

Turtle by John Van Druten or the two rooms in _Summer and Smoke_ by Tennessee Williams, there is ample opportunity for matched moves and positions to illustrate relationships. On one side of the stage a scene may fade out with a character walking in a dignified way down a flight of stairs. The scene fades in on the other side with someone also on a pair of stairs. The comment is up to the director. If the new character is a child dressed in adult clothes, a satirical comment is made on the first character. For example, the second character may be doing one of the following: running down stairs, in dignified manner going up the stairs, or wearing clothing that is different from the first character. The principle is this: the superficial activity is the same. Both characters are pictured in sequence moving on a pair of stairs; both characters are to be compared to each other. In the comparison, if the differences stand out a contrast is being made. This difference is what distinguishes these two alike characters. If in the comparison, the difference is of a certain variety, the audience may conclude there is no difference. In effect, if the difference is one of age, then the audience may decide the difference is really a symbol for the deeper truth about the first character. The child walking in adult clothes in a dignified way may suggest that the first adult character is really child-like in his attempt to be dignified. The possibilities of matching shapes and moves, of creating parallel situations to suggest parallel meanings, is only limited by the director's ability

to see analogous meanings in juxtaposed scenes and characters.

The wipe creates an impression of two pictures on the screen with the first being progressively covered by the second. Literally the effect can be obtained on stage with a scene shift, a wagon or flat drop and wing set moving in to replace the old set. In human terms an actor, or group of actors, can move across stage to replace a group already there. The effect is very useful if the script idea concerns the old giving way for the new or one group, or idea, replacing another.

A second useful suggestion for the stage is to use the wipe's passing impression of two distinct and separate pictures on the screen at the same time. Again the split stage, as in Summer and Smoke or other plays, will serve as a visual example of the method. The split screen showing two locations allows for two actions to be occurring simultaneously, or alternately, letting the audience observe relationships in two ways. First, the audience can compare the two actions for similarities and differences, movement by movement. Matched dialogue or movement makes possible the same contrast or comparison as in the dissolve. Second, the relationships can be contained in two entire, progressive, building sequences. The director merely needs to be concerned with keeping focus on one scene at a time while keeping up the impression of simultaneous scenes.

The purpose of the screen cut is accomplished on stage

by the eye of the audience as it shifts attention. The
screen cut is the direct and immediate following of one
shot by another; the effect is that of a jump and usually
suggests there has been no passage in time and that there
• is a very strong relationship between the subject matters
of the two shots.

The stage director learns from the film director that
the cut must be motivated; that is, the audience must want
to see the new picture because of the movement, content,
and implications of the old picture. A person on the screen
points with horror; the film cuts to the cause of the horror.
On stage a director often loses sight of his obligation to
point, and the audience eye does not jump to the new picture.
The stage director needs to motivate his alternation of
focus from one speaker to the next, in part by motivating
the shifting eye movement.

The fact of pointing changes the emphasis to the new
character. The way the pointing takes place will lead the
audience to establish a point of view about the conversation
and the participants.

On stage, however, the transition needs something
further than the point. It will be useful to use the
metaphor of a game of catch. Not only must the first
character throw the ball, but the second must catch it
before throwing it back. In effect, two new components
of transition are added through this simple analogy: a

connecting link and a reception process. If some moving
object, person, line, or compositional element can lead
the audience eye to the new speaker, the eye movement is
more certain and more strong. If the receiver moves, re-
acts, and then speaks, it is assured that the eye is
attracted to him in order to witness his contribution.

For a more complete way in which such an inter-
change may occur principles of the montage need to be
employed.

2-Shot Sequences Applied to the Stage: Continuity,
Simultaneous, Cumulative Montages. It is the contention of
this study that any editing of shots into a sequence is for
the purpose of giving the effect of a spatial or ideational
relationship between subjects, a relationship that cannot
be as immediately conveyed by any one point of view or
continuous view. Each edited sequence creates some sort
of addition of ideas, or subjects, that results in
relational statements more significant than any single
shot would make. Each sequence provides a cumulative
effect of some sort. For these reasons this study uses
one term to cover all shot sequences, and that term is
the montage. It is understood that many screen authors
reserve this term, however, for the cumulative, the sequence
of shots wherein there is no recognizable temporal or
spatial relationship between shots, often not even a
subject relationship, but merely some common theme that

ties each of the subjects together. To this study such
a montage is only the most abstract of the category, the
extreme in a continuum of shot sequences.

For convenience this study seeks to use classification
terms that are in common usage in the screen industry; how-
ever, the definitions are not identical to the industry.
The montage types seem to group most easily into three
basic, but not mutually exclusive, categories according to
purpose and proximity to reality. They are the continuity,
the simultaneous, and the cumulative montages.

The continuity montage, like mimetic movement, comes
the closest to simulating a real life sequence, and so is
not always thought of as an effect dependent upon editing;
but like stage mimetic movement the continuity montage needs
careful distortion and manipulation of the real to create
the impression of the real.

The purpose of the continuity montage is to create the
impression of a continuous sequence in time without any
lapses or jumps. The two basic forms of it to be discussed
here are the continuity of subject alone and the continuity
of both subject and context, each of which offers principles
for the stage director.

The continuity of subject alone is the succession where-
in the subject moves out of frame in the first shot and into
frame in the second shot. The usual purpose is to suggest
a subject continuity between changing contexts. The back-
grounds of the two shots are different such that the montage

suggests the subject has left one context and entered a new context. The passage of time between the shots is suggested by the degree of disparity between the backgrounds. If the backgrounds are on the same street it is assumed by the audience that no great passage of time has taken place. If the backgrounds are in different countries, a large passage of time has taken place: but in either case nothing significant is supposed by the audience to have happened in between. Hence a psychological continuity is established. The significant continuous action is seen rather than all the insignificant details of actual continuity.

To some extent the stage already shares the continuity-of-subjects montage's ability to compress action by the elimination of non-essentials in writing, by allowing a single object or movement to stand for many, and by letting time lapse between scenes. But the foreshortening or lengthening of time that is usually only filmic as accomplished by this variety of continuity montage is the elimination of segments of time right out of what seems like continuous action, time that is not needed, not useful, and hence not missed. For example, a man walks toward the bottom of a staircase; the film cuts to his approaching the top of the stairs. The man's purpose is seen by his approach; the fulfillment of his purpose is seen by his arrival at the top. The climb is not essential and is not missed.

A close look at the continuity montage of the man on the stairs will show at least four reasons why the elimination of a middle phase of action is accepted. First, the cut, or jump may cause enough of a shock in itself to provide a slight distraction from the missing time and space; second, the initial shot in a sequence ends with a location without the subject, a location from which the subject has just moved, while the following shot begins with a location without the character, a location into which the character moves; hence, there isn't the jarring immediate juxtaposition of a character in first one then another location; third, enough action may be taking place to distract from the mismatching of time; and fourth, perhaps the most important, the audience's desire, or at least willingness, to see only the significant parts of the action usually results in welcoming the elimination of an insignificant middle phase.

On stage the climb must be made because the actor cannot make the physical or temporal jump. How, then, can the stage benefit from the screen's discovery that foreshortening of realistic action may take place, and greater selectivity be made, by using only the portion of a movement that is significant? There are several ways. For example, when an action, for instance a realistic piece of business such as eating dinner, would take too long on stage, foreshortening is appropriate. Carrying the focus away from the business temporarily, much as in the screen technique

of the cut away shot, will distract the audience from the business and allow them to accept the idea that the bulk of the business was completed while its eye was elsewhere. Although the cut away, or reaction shot, on screen is really another variation on the simultaneous montage, it is sometimes inserted into the continuity montage to allow, among other reasons, a continuous action to be foreshortened. Even within a single shot, however, if the concentration shifts from movement to words, or from one person to another on the sofa, enough of a distraction has taken place to allow making many bits of business more compact, even to substituting props that are part of beginning bits of business (e.g., knitting), for some props already finished. This can be especially helpful when a particularly difficult process is supposed to be started and completed in front of the audience.

Temporarily eliminating the subject from the screen frame has its easiest application on stage in temporarily eliminating the actor from the stage. Much can be assumed accomplished off stage in a few seconds when the character is out of the audience sight. For instance, a twenty minute action will be presumed complete in but a few minutes.

For a longer passage of time, or assumption of business completed, the curtain may have to be drawn on stage. The director may well use, then, the continuity montage of subject alone to help him maintain continuity through a change

of scenes. If, for example, the director wishes to make the comment that nothing significant has taken place between scenes, during the change, and further, that the action of the play, or of a particular character, is continuous from the preceding scene, he may find elements to repeat from the end of one scene to the beginning of the next. By direct adaptation of the montage principle, the director may have a character move out of a scene at its conclusion and move into the next scene near its beginning, using types and directions of movement, clothing, motivation, and mood that are the same in both scenes. Even if the scene change is relatively time consuming the impression of continuity can be quite startling.

A reversal of the above scene-break use of screen continuity was effectively translated on to the stage in New Girl in Town. Most audience members are already aware of the continuity problem raised by having only one projector to show a two reel film. A particular action is usually stopped somewhere in the middle, then five minutes later the action takes up right where it left off. The shock of realizing that the film characters did not complete the action during the transition is usually a humorous one. This principle was used for the act break in the musical comedy New Girl in Town; George Abbot had all his principals involved in a chase and a fight around a vigorously kicking chorus of can can girls. The curtain descended at the height

of the action. About fifteen minutes later, the audience assembled and the curtain went up on the same place in the action where it had previously fallen. The analogy to a common film experience, uniquely used, was brilliantly comic and was applauded heartily. Partially because the audience is used to the convention that action has progressed when the camera, or the stage, cuts back to a previous location, the impression was that the dancing had continued unabated during the entire intermission. And since it was but one of several filmic oddities that Abbot employed the filmic frame of reference was clear to his audience.

The montage that involves continuity of both subject and context is the succession that starts with a long shot, proceeds to a medium shot, and ends with a close-up. The opposite order, from close-up to long shot, is also common, though less frequently seen. The method of the sequence of long shot to close-up is to take an opening long, or establishing, shot and then to take additional shots of increasingly smaller portions of that opening shot; the purpose is to provide a context for action, then to provide the action which is in turn the context for a detail, and then to provide the detail. The reason for such a sequence, of course, is to match the emphasis pattern frequently implied by a script, but often the implication is not obvious. To use the montage requires an interpretation of the script, aided by a knowledge of the montage. The

montage rarely occurs to a director as a solution without
prior knowledge of it.

The long shot to close-up sequence may be applied to
the stage in many forms but one example should suffice. In
the sequence, a cut changes two relationships at once: a
large amount of the context of a subject is eliminated and
the subject itself is greatly enlarged. To accomplish both
of these relationships on the stage may not be possible
except in quite different terms.

To reconstruct the montage on stage there is first
the equivalent of the long, or establishing shot. The
entire context of the scene is on display. To insure the
audience eye roving casually all over the stage, action
can be going on throughout, as in the manner of the crowd
scene, but milder in import and intensity. Or the scene
can be empty of actors allowing for a casual audience
survey of the scene's static content. Into one of these
establishing situations, one character draws attention to
himself and his activity. He may be looking for something,
and the composition of actors converges into his area to
aid him in the search. Action in other parts of the stage
ceases and a narrowing of attention occurs to include only
a small group. The lost object is found and focus is
desired on the object found. All movement ceases except for
that of the character who has found the object and of the
object itself. Lines of composition point to the object as

it is turned over in the hands of the finder. Audience perception has been successively narrowed down until it is concentrated in a close-up. However, the narrowing down does not yet accomplish the change in scale permitted by the film close up.

To accomplish the close-up at the conclusion of the above sequence, every technique of emphasis is needed, and audience attention cannot be maintained for long. In addition to lines of composition, also a sudden movement, a sudden freeze, an enlarged movement, exaggerated concentration on the part of the character on stage, and subtle lighting changes can all contribute to the apparent enlargement of the object in focus. Even a sudden sound from the object itself will help the feeling of focus. The book slammed on the table, the piece of pottery tapped like a bell, or the sudden expletive from the discoverer may all help to provide a close up feeling.

The next problem the director faces is how to loosen the close-up and to keep the loosening under control. The audience's mind and eye will quickly leave the close up and start to wander. Such wandering should be anticipated and controlled as much as possible. Reactions from members of the group, vocal and physical, the passing of the object and setting up of new physical relationships of the object to other objects or characters, will help to provide the equivalent of a montage of new focal points. When interest

in the object is exhausted, the group may be dissolved into new movement patterns and sounds, thus loosening the close up to another long shot with general movement and widespread attention.

A special application of the continuity montage concerns creating the impression of continuity through lengthening rather than foreshortening the screen time. Although foreshortening is the more usual need, the converse is sometimes the case.

As has been previously discussed under the subject of slow motion, simultaneous actions may be presented successively in order to spread them out for scrutiny. Sometimes in film part of an action may be presented not only in isolation but twice; actual overlapping shots are joined without an overlap being apparent. If a great deal of excitement is in a long shot on the screen and the hero is moving up some stairs and into a door, some of his action may escape notice. He may open the door and start to enter the house. At this point the director chooses to cut to inside the house and to show the hero entering. He may show again the opening of the door from the inside without the audience being aware of the overlap.

Applied on stage the overlapping action is perhaps not literally usable except possibly to end one scene and to begin another. The most usable application is apt to be the sequential or lag version of lengthening time where a

simultaneous action is broken down into parts and performed consecutively. Here are two possible stage examples. In real life the opening of a window shade is simultaneous with the light streaming in. On stage if the director wishes to draw attention to both the act and the result the hero raises the window shade and then the light streams in; or some light comes in as he opens the shade but then the whole room gradually becomes lighter. Since attention is first upon the action of the opening of the shade the audience can accept a slight lag in the results of the opening.

In another example, the hero leaves the house amidst general crowd hubbub--the slamming door freezes the crowd. Someone runs to the window and the hero passes. In real life the hero would have been by the window much sooner but distractions allow either the screen or stage director to delay the hero's passing somewhat until the second character can rush to the window, until, that is, the psychologically ideal time. Hence by lengthening real time through application of a continuity montage principle, apparent continuity is produced.

The simultaneous montage, the second basic type, tends to suggest the existence of two actions occuring at the same time; it does so by cutting back and forth between the two actions. The alternate presentation of the two is usually necessary because the actions, even though occurring at the

same time are too remote in space to be encompassed in the
same frame at the same time. Sometimes the two actions are
purposely separated in space in order to take advantage of
the particular qualities of the simultaneous montage.

The prime use of the simultaneous montage is to share
focus alternately instead of simultaneously while creating
the impression that two actions are occurring simultaneously
and are related. In the screen version only one character,
subject, or action appears at a time, though it appears that
the actions continue even when they are off screen; hence
individual focus is assured as much as is humanly possible
with simultaneous action. On stage both actions actually
appear simultaneously, and so focus must be made to alter-
nate primarily by compositional structure. Of course in
all cases the director must realize that the audience's eye
is free to wander at will over his composition; he can never
hope to control focus absolutely; however, the techniques
suggested are hoped to show what has been derived from
screen directors to increase the stage director's control
of attention, and to narrow the range of uncontrolled
attention.

There are two general types of simultaneous montage.
The first is where the subjects are too remote to be aware
of each other's actions at the moment, and the second is
where the subjects are shown to be aware of each other.

In the first version, the relationships between the two subjects are not of action and reaction, but of matched purposes, actions, or themes whose matching is for the purpose of showing a comparison or contrast, or to suggest a future coming together of the two remote actions. Most of the suggestions this study would like to make concerning this variety of montage have already been made in connection with the previous discussion of the matched dissolve. The split stage technique would seem to be the most apt adaptation, wherein two remote locations are depicted simultaneously with alternating focus maintained by lighting. It remains to note that in the remote simultaneous montage the characters are unaware of the parallel situations. Each is only a participant in his own scene. It is the director, in conjunction with the playwright, who alternates parallel movement and words to suggest that one scene, character, or object symbolizes another; one contrasting element explains a fundamental difference between the scenes or else is symbolic of an underlying similarity.

The second variety of the simultaneous montage borders on the purpose of the continuity montage in that it involves alternate attention on two subjects who are reacting to each other. For example, two characters in the same room are in conversation with each other, but are too spread out to be seen in one camera shot, or, on stage, to be seen in one eye fixation; they may receive the alternating cutting

technique, or on stage the alternating eye fixation. To be
sure, on the screen a fast pan would serve a similar purpose,
but it is usually the case that the context between the
characters is not important enough to get that much attention.

Two basic images for the second variety of simultaneous
montage might be the chase and the game of catch. The chase
suggests a situation where there is continuous independent
action by both participants in the montage, though the
director actually saves his significant action to be carried
out by a character when he is in focus and usually the
director motivates the cut by some pointing device that
makes the audience want to see the second character.

The game of catch suggests a situation where there may
be continuous simultaneous action but where the audience may
feel that a particular action must be completed in order to
receive a reaction, and in turn that reaction must be
completed in order for it to receive a counter action. In
other words, the significant action always seems to the
audience to be in focus in a cause and effect continuity
sequence. In the game of catch image, if there is really
some counter part for the ball that carries audience
attention between characters in a series of alternating
cuts, and the subject of the scene is the ball, then the
sequence is a continuity montage. If there is no actual
object passing between two characters, or the object is
not the subject of the scene, then the montage is of the

simultaneous, alternating focus, variety.

One example of this type of simultaneous montage in action involves a safe cracker and the safe owner. Focus can be alternated between the two characters as follows: In the scene a noise occurs; a metal case bangs against the safe door as the case is extracted. In real life the owner would turn around immediately, discover the theft, react, and the thief would fight or run. The whole procedure would be lost in its simultaneous presentation.

The director has decided the process is important and is not to be covered by divided focus. Therefore, when the case hits the safe the thief freezes, then he slowly looks around at the owner. At that point the focus switches to the owner. Now the audience is expecting a reaction and is ready for it. The audience sees the owner stop talking and slowly turn around, puzzled, looking at the thief. Since the focus now switches to the thief, the owner freezes while the thief startles, grabs the box, slams the safe door, and looks back at the owner before he starts to flee. The owner recovers from his shock and starts shouting and chasing; the thief runs.

In the above example, a serial reaction is employed along with a slowing down of the individual component actions. Two purposes of the screen montage are thereby accomplished on stage. First, the alternating focus is controlled by movement and pointing, and second, the intense

interest in the significance of that movement keeps the audience from noticing that there is something unrealistic about the pace or the serial presentation.

An example of the serial presentation of simultaneous reactions already exists in the Kabuki theatre. Using the convention, all characters but one freeze on stage. The one goes through a stylized version of his complete reaction to an event, then he freezes. This process is carried out until each chief character has displayed his unique reaction to the event. It is similar to the simultaneous montage in that there is a controlled alternating focus and that the same portion of time is shown over and over again but from a different point of view, with a different content, and in a different location.

Another, more realistic, method of alternating focus during simultaneous action on stage is by a wave technique. Larger, more rapid movement is carried by the speaker in focus; his movement subsides, becomes slower and smaller, as the second speaker takes over. The completion of a wave's peak of focus may be followed by a gesture, a look, a body facing, or an inflexion that tosses the scene back to a second character. Carrying the montage analogy still further, the screen director can totally obliterate one character while a second is in focus. The stage director may accomplish this purpose imperfectly perhaps by placing his in-focus character in strong body positions and stage

areas while the out-of-focus character is in weak body positions and stage areas. In the extreme, the non-speaking character may work to an up stage position with his back to the audience while the speaker is downstage facing the audience. If the style of the play allows, lights may dim out on the character not in focus, or the in-focus character may reappear from doorways or from behind scenery. If realism is necessary, then a subtle combination of all of these methods of changing focus may be used to isolate the character in focus as much as the style will allow. When the speaking character must be the most in isolation, the second character can be temporarily off stage. When the speaking character needs only to be in dominance the least isolating relationship can be used, almost approximating a camera two shot.

Of course the analogical possibilities of the simultaneous montage are not exhausted here; but the images of the chase and the game of catch combined with examples of the split stage, the serial reaction of the Kabuki theatre and its more realistic counterpart in a wave pattern of reaction should start the director's analogical imagination working.

The third basic sequence of shots is the cumulative montage, the least realistic and the most complex sequence to create either on screen or on stage. It is made up of a juxtaposition of shots, obviously not of continuous action, often of subjects unrelated in time or space, subjects

largely related in theme. Of the two basic varieties, the
dialectical tends to create a cumulative effect of action
and reaction while the single concept variety tends to
create the cumulative effect of a particular mood, a large
event, an unusual comment, or an over meaning that is
greater than the sum of the shots and is not contained in
any single shot.

The dialectical variety is basically a cause and effect
montage of two shots, or of two divisions of shots, juxta-
posed in such a way that the audience is expected to draw a
conclusion. A simple example is a shot of an animal with
bloody teeth followed by one of a man with a wound. The
conclusion expected, of course, is that the animal bit the
man. A larger framework for the same kind of relationship
would be society as a whole. Shots of the rich getting
richer and the poor getting poorer could tend to suggest
several conclusions depending upon the editing of the shots
and the exact nature of their content. The conclusion might
concern revolution, extinction of the poor, the necessity
of unions, or the richly deserved stations in life. And, of
course, the less realistic, the less spelled out, the more
the conclusion will depend upon production context and
audience experience.

The social application of the dialectical variety
obviously overlaps into the single concept version of the
cumulative montage, which is the least realistic of the two.

Usually it doesn't even suggest a time, space, or causal relationship between any two juxtaposed shots, rather it suggests that each shot has in common with its companion shots the substantiation of a common theme, mood, or concept. Each shot suggests a different aspect of the common theme until the audience is expected to draw a conclusion, much as in the inductive method of collecting data, that the single concept has been established. Depending upon the director's decision, such a montage may or may not actually depict the conclusion. If it does then the audience should be ready to say with the director that they too have come to that conclusion. In effect, then, a statement of a conclusion, a summation of the shots, may be redundant if the montage is well designed.

The applications this study has employed and will suggest for the cumulative montage will be less analogical than for the other montages and more direct. The most literal application would be the use of an actual film insert on stage. Using a wide angle projection lense, or a rear screen projection technique, the back cloth of the stage setting can become a screen. The insert sequence could use the actors who are in the play or stock shots that provide a larger context to the play. Such a method not only shows exteriors that cannot be shown on stage but allows the screen's techniques of enlargement, selective focus, and compression to have a direct effect upon the

play. Such a use also allows for more traumatic dramatic
action to be presented because of the increased psychical
distance of film. Dangerous, exotic, erotic, or horrifying
sequences, shown with the actual stage actors can have the
impact of the screen without having the consequences of
the audience being as revolted, antagonistic, or fearful
as the same sequence live on stage would make them.

One technique of combining media was employed in New
York in 1964 under the title of Laterna Magika with results
that can be a warning to the stage director. Originating
in Czechoslovakia, the technique employed from three to
thirteen screens and many projectors in a three ring circus
tour de force of live actors and filmic representations of
them. According to several critics the effects were startling
and even amusing, but not really well integrated. Time
magazine felt that the live actors just couldn't compete in
volume or size with their screen counterparts;[1] while The
Nation, agreeing with Time, felt the actors were an actual
intrusion, as if theatre ushers had ascended the stage and
were getting in the way of the filmic action.[2] Of course
Laterna Magika was produced not for integration but for
shock, for spectacle, for trickery, and for technical
"Magic". For a comparison, Laterna Magika is to the

(August 24, 1964), pp. 79-80.

adaptations this study is suggesting what vaudeville, the circus, or Hell's a Poppin' are to the legitimate theatre.

Unfortunately Laterna Magika utilized the unique powers of the screen media to the point of overpowering the stage. The producers chose to overlook the problems of scale in both volume and size, and completely mixed, in the same stage plane and at the same time, the oil of the film image, that is flat but appears three dimensional, with the water of the live actor, who is three dimensional but often appears, to the distant live audience, to be flat. The live tree and the painted tree can fit on stage together, but not naively, side by side, without any doctoring or accounting for their differences.

For those stage directors who feel the actual screen image on stage would be an intrusion, the second most direct method of adapting the cumulative montage to the stage could be used: the live staging of the montage. Such an adaptation can be made in several ways and for a variety of purposes. A few examples will suffice. First, the director must determine what kinds of situations or sequences will lend themselves to stage montage, and second, how they may be staged to allow for maximum integration into the script.

Some sequences that can be replaced or augmented by montage are as follows: the messenger reporting an off-stage event, a subplot, a large event such as a battle that

occurs off stage between scenes, crowd movement, an emotional climax that occurs at the conclusion of a scene, group attitudes in contrast to each other or to the attitudes of the main character, and various background actions that may be parallel to, or symbolic of the main action. Of these, two types of scenes emerge. First is the on stage depiction of what is usually large off stage action; second is the on stage depiction of an underlying or contrasting mood or emotion.

An example of how cumulative montage may be employed to revitalize off stage action is in the example of the Greek messenger. Perhaps in the original scene the messenger is describing the fall of an army in battle following which description the victorious general enters the scene. To integrate the montage technique into a Greek play the chorus and general may enact the montage. A symbolic battle, in small scenes in various parts of the stage, may show in montage fashion the onslaught, turning of the tide, and defeat of the army. Such a sequence can be stylized in dance choreography. The speech of the messenger may be foreshortened, edited, deleted, spoken antiphonally with the action, or whatever seems appropriate to the scene. Melodic or rhythmic instruments may help to stylize the action so the audience does not expect realism.

To be sure, musical comedy has already employed techniques of expression similar to the montage. It remains

for the play director to make adaptations that suit his
particular stage form. Borrowing old ideas and giving them
a new form and context is one of the most rewarding methods
of creation. The familiar and the new are combined to give
fresh perspective on both meaning and matter. The dance
sequence is one such example. Pantomimic scenes in plays
would use a combination of the dance sequence of the
musical and the montage of the film, and, perhaps in more
realistic fashion than the dance, draw attention to the
pictorial aspects of theme and plot.

A typical pantomimic sequence, illustrating the second
major category of filmic cumulative montage, might be an
insertion of a montage in the conclusion of a love scene.
The montage would enact the dimensions of the emotion
instead of the mere proximity of the individuals. To
illustrate, usually in the conclusion of a love scene, when
two people find each other, there is an embrace. The
positions are relatively static but the emotions are strong.
The realistic approach is to fade out on the embrace. The
motion does not reflect the emotion. Often music carries the
emotion of the climax and builds during and beyond the fade,
or curtain, to suggest the growing passion of the embrace.
An alternative, used by musical comedy, is to have a couple
dance or sing together, usually also followed by the static
embrace. The montage approach could result in an action
conclusion and punctuation, combining screen montage with

musical comedy. A choreographed sequence between the two actors, with accompanying music, could pantomime their relationship in abstract line patterns combined with stylized realistic pantomime; such a sequence could use as its metaphor a chase, or the bubbling brook, or a bouncing ball, or whatever seems appropriate.

The choreographed sequence could, alternatively, involve background action that takes over as a foreground fade out occurs on the main action. As an example, the lovers could sink into an embrace on a foreground couch, either concealed or in silhouette. Behind a scrim, or outside a picture window, movement starts. Happy laughing people, conflict scenes, shouting, chasing, horn blowing, music playing, all build to a climax. In a fantastic interpretation, either two dancers portray the two lovers, or else other characters in the play provide the montage, while a fantastic lighting separates them from the two lovers.

Such a montage of underlying emotion could also provide contrast as much as support to the main action. In fact, the kinds of elements chosen for the montage will determine what comment the director wishes to make on the emotional realistic scene.

Less direct methods of applying cumulative montage principles abound. Crowd scenes, climax scenes, rapid dialogue repartee scenes, action sequences, and scenes

whose meaning is largely carried by movement all can profit from montage principles.

The crowd scene is perhaps the easiest to adapt. The screen battle, or crowd, montage usually starts with an establishing shot, to give a context to the whole sequence. Then occurs rapid and rhythmic intercutting of typical actions, facial expressions, parts of bodies, and objects that express in sequence rather than simultaneously the idea of the battle or of the crowd's purpose. On the stage the simultaneous presentation is difficult to avoid but the eye can be directed in staccato and rhythmic fashion to various places in the action to create the excitement of the montage sequential crowd depiction.

The staged crowd scene usually suffers from either of two extremes: it is too active or it is not active enough. The too active distracts not only from the main action but also from itself; it eventually becomes tedious, giving the audience too much perspective and not enough immediacy; it reduces the crowd to mass, undifferentiated movement with which it is difficult to empathize. Also it may allow the attention of the audience to wander at will with little control of focus by the director. Often weaknesses in staging are spotted more easily if un-differentiated movement continues. However, if the eye is led on stage (as it is more forced by the screen montage) the entire audience, to some extent, can be swayed by the

rhythm of the sequence and be led to the same details at the same time.

One way to adapt the consecutive crowd shots of the cumulative montage to the simultaneous stage scene, while retaining some of the qualities of the screen, is to plan consecutive focal points in the action. A quick move accompanying a shout, or other sound, will draw attention to itself; a temporary isolation of a character or a unique body position, or a rapid physical interplay, or a placement in compositional emphasis, or a combination of all these, will alternate the person in focus in the crowd. These attracting sounds or larger actions can be timed to provide a beat, or a rhythm, desired by the director for the scene. Surrounding the accented movement the rest of the crowd can keep moving, reacting, acting, or whatever, but in ways which will keep it deemphasized until some segment of the total scene needs to be again in focus. Thus by using stage compositional elements, carefully choreographed, various individuals are alternately emphasized and deemphasized at appropriate moments. The simultaneous stage crowd can thus isolate typical details in rhythmic sequence as does the screen consecutive montage.

3-Conclusion: Advantages and Limitations of Montage Adaptation. How the director introduces elements into his montage adaptation is largely a matter of his analogical imagination. What can substitute *for a close up, for a shot*

of some object-symbol, or for nature as an actor? Perhaps nothing will substitute directly, but the purposes of each may be fulfilled in different ways. For example, the screen use of fields of waving grass, storm clouds blowing, ocean waves dashing, and streams bubbling may be difficult to apply to the stage. Still, they may be applied, possibly as metaphors to supply qualities of movement for the actor; or, more closely approximated, as pantomimic dance accompanied by music. Certainly a direct stage application of the screen's ability to present nature as an active participant may not be practical. However, the other possibilities of both direct and analogical adaptation of screen montage to stage purposes seem to be well worth the adaptation effort.

3. Composition in Motion Within the Screen Frame, Adapted to the Stage

Now that some of the screen's abilities to manipulate time and space with shots, joinings, and sequences have been related to the stage, attention is turned to the peculiarities of the screen picture itself, principally to its composition in movement.

a) Economy Within The Frame.--From the television field, Biegeleisen advocates overlap of scenic units combined with simplicity of composition.[3] His points are that

---

[3] J. I. Biegeleisen, Poster Design (New York, 1945), p. 89.

the overlapping of compositional elements helps to lead the
eye around the composition, while a minimum of elements
helps to make a clearer statement of compositional intention,
or meaning.

From Biegeleisen's suggestions the stage director
can learn to maintain an interconnected but uncluttered
stage picture. Nothing on stage should be without purpose.
Further, if something on stage is not actually, physically
used perhaps it should be removed. If something on stage
is a symbol and only used as background, perhaps it can be
made to have a more practical purpose. If something is
seen to carry the same symbolic connotation as something
else, perhaps one of the two things can be eliminated. In
short, from the television screen, the stage director should
learn economy of means. Cluttered ideas, cluttered symbols,
redundancies, and elaborate compositions are apt to confuse
the audience and conceal the purpose of the symbols. Even a
script that requires ornate production can well use a
modified selective realism, that is, one simplified symbol
can stand for the ornate whole, and thus convey the idea
"ornate" graphically and immediately without actually being
ornate.

b) Movement Within the Frame.--The moving content of
a screen picture uses ideas from the still picture but
with certain definite modifications and for certain definite
purposes that can, in many cases, be readily adapted to the

stage. The more important movement purposes served seem to be for contrast and impact, for motivation, and for depth.

1-Movement for Contrast and Impact. For greater contrast and impact screen composition of elements is usually sequential rather than simultaneous. Eisenstein points out that alternation of contrasting pictures makes a stronger contrast than simultaneous contrast within a single frame; a background, no matter how it contrasts with foreground action, is static and is soon unnoticed.[4] However, he notes, if the background is presented in alternation with the foreground, both will have a stronger impact and consequently so will the contrast. Of course the stage director is less able than the screen director to move his static background in and out of the stage picture; however, he can still be warned by the principle of moving contrasts. He can be reminded that his scenery, his static furniture arrangements, his color schemes, even his pictures composed of stationary actors are quickly assessed by an audience and almost as quickly become unnoticed. So from the principle of contrast by alternation the stage director can more readily assess how actively or inactively involved are his scenic elements in telling the story of his play.

2-Movement for Motivation. Television findings concerning
eye movement seem to have important implications for the
necessity of motivating subject movement. Bettinger, in
the field of television, has learned that the audience eye
tends to lead a movement, as if to see where the movement
is going. If a character is moving, the audience eye tends
to move ahead of him to divine the actor's purpose .[5] Not
only does the eye lead but Bettinger points out it tends
to move along contours and lines and to jump from greater
to lesser contrasting points, or intersections. Such a
discovery supports strongly the need for motivated movement
in all its motivational dimensions.

A character needs, in order to take advantage of all
of his potentialities for communication of meanings, at
least a three part motivation for every move. What
Bettinger's study supports is the need for a motivating
destination, for the audience eye seeks a destination out
and should only be disappointed for some very good reason.
His study also supports the careful use of line and contour
for the movement since the eye follows this contour, dis-
cerns it, and interprets it.

The use of internal motivation, the outward appearance
of the character's inner purpose, is supported by every

---

[5]Hoyland Bettinger, Television Techniques. Revised by
Sol Cornberg (New York: Harper and Brothers, 1955), p. 170.

author who discusses motivation for a cut in television or
in film. Some anticipation, some pointing, some expectancy
is set up within a shot to motivate cutting to a new shot.
Often this motivation to cut is supplied by an actor showing
an interest in something outside the frame. The interest
is satisfied by cutting to the object of his interest. On
stage the audience interest is satisfied by the actor's
eye movement to the object of interest and then the audience
eye leading the actor's movement to the object. The screen
in this, and many other ways, can enrich the stage director's
conception of motivating movement for suspense, audience
satisfaction, clarity, and believability.

3-Movement for Depth. Film can also contribute to the
pictorial staging of movement in the use of three dimension-
ality. Spottiswoode discusses the phenomenon of the screen's
two dimensionality appearing to be three dimensional.[6]
Part of the effect is, of course, produced because the camera
can record great depth in actual surroundings; the screen
picture can record the contrasts in size of objects and
speed of movements that result from actual perspective.
The screen's own adaptation of the location camera's ability
to catch perspective is the multiplane camera. It allows,
for example, Disney, in his more elaborate cell animation

---

[6]Raymond Spottiswoode, Film and Its Techniques
(Berkeley: University of California Press, 1958), p. 40.

process, to reproduce the effect of three dimensionality within a small studio.[7] An application of its principle can be of value to the stage director who also has limited actual depth. The purpose of the multiplane camera is to create the impression of depth through varying the speeds of motion and the size of objects at different depths in the picture. It creates a forced movement perspective. It also uses alternations of dark and light moving depths both to contrast the depths with each other and to lead the eye past the dark foreground framing plane into the depth of the picture. One way to illustrate the effect in real life is with the view from a moving train. The foreground objects, telephone poles and the like, seem to go by at a rapid rate; middle ground objects such as houses and trees, go by slower; while background objects, such as mountains, go by with almost imperceptible speed. The multiplane camera uses drawings placed in planes several inches apart and drawn to resemble the objects in the various foreground to background planes. As the animation camera takes pictures of the foreground cartoon character the various planes are moved behind him at varying rates to resemble the apparent rates of speed of planes at different distances from the plane in which the cartoon character moves. The result is the appearance of great depth. Of course the stage director

---

[7]Ibid., p. 138.

cannot easily move the audience point of view, as in the illustration of the moving train, except possibly with revolving and wagon stages; however, he can use some of the principles of this screen effect, even with a stationary audience, to return to his stage more of the feeling of depth that it often lacks.

The stage director can adopt the multiplane idea directly onto his stage by analogy. The background plane is his background static scenery. His foreground is his downstage actors in focus. Here are his two limits: unmoving background and rapidly moving, enlarged moving, animatedly moving downstage characters. He now needs to establish one or two other planes of movement and possibly a dark downstage frame, in addition to the ever present proscenium, if he wants to create the impression of greater depth.

Each plane can have its own appropriate speed and size of motion and possibly even size of objects, without the audience point of view necessarily moving by the stage. In effect, the stage composition moves by, or in relation to, the audience.

In a crowd scene, the participants can best be grouped in depth either on a raked or a stepped stage. To suggest the reduction in scale, upstage people can be shorter, or seated. To give the impression of reduced scale without actual size change, movement can substitute for size.

Smaller moves, slower moves, less distance covering moves,
graded in planes, can to some extent capture the idea of
the multiplane camera and increase depth of stage through
stage movement. The relatively shallow stage picture can
thus recapture some of its three dimensionality through
analogy with the screen.

c) Camera's Point of View Reflected in The Frame.--The
composition of the frame's content and its meaning are
functions in part of the camera's special ability to adopt
almost any point of view while using a variety of lenses.
This special ability can provide some instructive analogies
for the stage director.

The camera's versatile point of view is something for
which the stage provides no simple substitute. The camera
can be in a variety of planes and move in a variety of ways
whereas the audience for a stage play must always see the
action of the play from its seat in the auditorium.

Many of the typical camera movements and positions,
such as the pan, the tilt, the close up, and the long shot,
have already been discussed. However, the meanings that are
imparted to the screen because of the camera's point of view
and their implications for the stage, are the more subtle
subjects to be covered here.

1-Point of View of Camera as Point of View of Audience. One
of the normal assumptions that needs to be questioned and
clarified is that the camera's point of view becomes the

audience's point of view. To clarify the concept two of the camera's viewpoints need to be examined. Subjective and objective viewpoints are described as those which view the action from inside the story and those which view it from without. A typical subjective camera technique is the follow shot, usually a trucking, or dolly, shot, where the camera goes right along with the action. Perhaps the camera follows beside a man walking. An even more subjective technique is described by Spottiswoode as the result of a hand held camera. The cameraman walks, runs, or falls while holding the camera. The effect supposedly places the audience in the position of the moving person.[8] By convention, present day audiences seem willing to enter into the technique and pretend they are seeing the action as if they were a part of it. The problems arise when it is attempted to discover with whom or what the audience is identifying. Is it with a character, with some mysterious third person who is going along within the action, or is it with a complex multiple person who now sees from one subjective view and now from another?

The first observation is that the point of view of the camera seems to vary independent from the audience identity with one or more of the characters. For example, an over the heroine's shoulder shot of the hero, as seen by a woman,

---

[8]Spottiswoode, op. cit., p. 31.

may make her think of herself as the heroine. But the same shot probably makes a man think of himself as the hero. A follow shot of the hero probably puts the audience beside the hero, from the point of view of the camera, at the same time the audience identifies with the hero. If the follow shot then cuts to a hand held moving camera shot probably the audience point of view is suddenly the same as that of the hero and as that of the camera. Such a cut may be disturbing, for example, if a woman was imagining herself beside the hero and suddenly finds herself inside the hero. When a camera point of view is over the shoulder of a monster attacking a hero, the point of view of the camera would seem to be that of the monster, but it certainly isn't intended that the audience adopt that point of view, or identify with the monster. Instead the audience empathizes with the hero and in turn fears the looming foreground figure.

Possibly the audience does not think of itself as the hero through seeing what the hero sees so much as through seeing the hero himself; it is only through the latter that it may empathize with the hero, though it is through the former that it may feel the same motivation as the hero. In effect, the audience would seem to adopt a point of view in film according to where its sympathy lies, and its sympathy is usually aroused by the emotional content of the scene, rather than by the point of view of the camera.

2-Point of View of Camera as Ideal Point of View. The camera, then, seems to provide an ideal audience point of view rather than any simple objective or subjective audience viewpoint. It seems to fulfill its chief role in presenting characters in relationship to each other. The camera presents them in ways that will best express the underlying meaning of the script more than it substitutes for the point of view of the audience. The camera gives the audience an ideal viewing position, whether it is in the middle of the action or at some distance from it. The camera allows the audience to see over a shoulder, up from the floor, through the window, or wherever it can best see what is going on. The camera's contribution to point of view seems to be more subtle than simply the replacing of the audience point of view, except point of view in the above very practical and physical way, rather than in an identification way.

3-Point of View of Camera as Revealer and Concealer. One of the subtleties of camera point of view consists in what the camera can reveal and conceal. In the over-the-shoulder shot the camera reveals a reaction by one character while concealing the reaction of another. By simple inclusion or exclusion from the frame any subject may be revealed or concealed with ease. Of course the over-the-shoulder shot has a special significance in that the person whose reaction is being concealed is in the frame.

By reversing the angles the revealed becomes the concealed while the concealed immediately becomes the revealed.

On stage the director can use this principle to greater advantage than he usually does by using more alternation of face and back by his characters. Many directors seem to prefer a relatively shared stage position between two characters even though the script may not always call for an equal emphasis upon both characters.

Of course a rapid repartee scene on stage is difficult to transcribe into reverse angle technique, since it is the actor who must move back and forth in order to change the audience point of view, but the ingenious director can devise an equivalent for short periods of time. An up-to-down-stage pacing maneuver would be one such device.

4-Point of View of Camera as Distorter of Reality. Another subtlety consists in the way the camera's viewpoint can distort reality in order to provide a comment about that reality. For example, in the low angle shot a character looms large over the camera and is thus expressed to the audience as looming large over them, as being strong and portentious. A feeling of looming may be possible on stage when principles of facing, of elevation, and of audience identification are combined. A character may be sitting with his back to the audience, which will make him weak but in a way that may arouse audience curiosity; another character may stand facing both the weak character and the

audience, making him strong by contrast, by facing, and by elevation. As the audience watches the action of the scene described above, with the standing figure looming over the sitting one, the audience may be objective and merely recognize the relationships between the two characters. To include the equivalent of the camera point of view, however, the script and the director should have established prior to this scene a strong audience identification with one or the other of the two characters. If the audience has identified with the character who is sitting the audience may imaginatively assume the low angle camera point of view, and the standing figure will appear to loom with greater force. Should the audience identify with the standing character, the audience is more apt to assume the equivalent of the high camera angle and to feel secure in the role of the "loomer."

The audience may feel suspense to add to the feeling of looming. Identified with the standing figure, the audience may wonder what he sees; identified with the sitting character, the audience may wonder what his reaction will be. The suspense of not knowing is apt to increase the sense of looming. Given the same relationships between characters but the standing man with his back to the audience, perhaps the suspense and mystery will increase the looming even more.

5-**Point** of View of Camera as a Function of Lenses. Another
role the camera plays is dependent upon its lenses. The
wide angle lens will serve as a sufficient example for
adaptation to the stage. When viewed through a wide angle
lens, a straight line of people, at right angles to the
point of view of the camera, appears to be curved. The two
ends of the line appear to curve back away from the camera.
Therefore, to create the impression of a straight line the
line must actually be curved such that each person is at
the same distance from, and facing, the camera. A person
in the front row of a theatre audience has a comparable
sensation when a man crosses the stage. Although the
audience member knows the character is walking in a straight
line, parallel to the plane of the proscenium, still the
character is first approaching and then retreating from
the audience. The character's face, then side, then back
is seen as he crosses.

This optical illusion of the wide angle lens and of
the close member of the audience may suggest some ideas to
the stage director. First, if the director wishes to
simulate the purposes of the screen follow shot, that is,
to have the audience maintain a constant focus on a crossing
character, then he will wish to maintain a consistent and
constant relationship between the audience and the char-
acter; a curved cross may be the most effective way.

The long curved cross may also be strong because of
audience eye movement. It is generally agreed that the

eye jumps from subject to subject over a static scene, or
from phrase to phrase when reading words from a static page.
During the jump there is no focus, and there is only a blur.
The eye does not seem able to move gradually across a field
and remain in focus; however, when the eye is following a
moving object, the eye seems to maintain a stationary focus
on the moving object, and the background is blurred. Hence,
in a camera follow shot, and in a focus maintained on an
actor during a cross, the background can become blurred thus
strengthening the actor. If the actor keeps the same
relationship to the audience as he moves the eye is not
tempted to, and need not, make a jump, and the actor may
maintain a greater strength than in an actually straight
cross. The director may thus minimize the weakening effect
of the long cross and maintain a stronger focus on a moving
character.

6-Point of View of Camera: Conclusions. Conjectures about
how the camera point of view can be adapted to the stage
and audience relationship have infinite possibilities for
formation and testing. Simply by, first, replacing the
camera with the audience in an analogy and then, second,
seeing how the added dimension of audience identification
may influence where the audience thinks of itself as
being, the director may open the door to all kinds of new
movement possibilities. One of the most daring, perhaps,
is to reinstate some version of the mystery play stage in

which the audience actually moves about. Thus the modern
director could experiment with giving his audience physically
the "ideal" point of view of the action.

C. Principles of Live Television Considered
for Adaptation to the Stage

1. Introduction: Immediacy and Spontaneity of Live Television

For this study immediacy is defined as a combination of
proximity and ideal point of view, whereas spontaneity is
defined as the appearance of, or actual, first time un-
rehearsed presentation, hence a presentation whose outcome
is uncertain. It seems that live television may be the
medium that has these qualities together more than any other
medium, and these qualities seem to have certain values
for the stage.

The film and the stage both present what is usually
pre-planned material. The stage play is usually well
rehearsed while the film is, rehearsed or not, permanently
set on a plastic strip in an unchanging performance. Film
brings the audience closer to the action than the stage but
is canned; the stage presents live action, but it is pre-
set. Only live television,though often as pre-planned as
the stage play, can provide an audience both with the
immediacy of close-up and ideal point of view and with the
spontaneity of reporting an actual event while it is

happening. Such qualities distinguish the medium and are its chief attraction. The quiz show, the football game, and the interview all picture events whose outcome is uncertain, yet events which are usually structured for maximum interest, conflict, and suspense.

The order of spontaneity and the order of immediacy among the media seem to be quite different. Perhaps the order of spontaneity might be as follows: first the live event, then the televised event, the radio broadcast event, the stage presentation and finally the film. The order of immediacy, on the other hand, seems to be first the film, just slightly more than live television, then the stage, then the live event, and least of all the radio broadcast. It seems that the screen can get an audience closer and more ideal views than can a live event. Hence, it would seem that the medium with the greatest combination of immediacy and spontaneity would be live television rather than either the live event or the motion picture film.

Can the stage director in any way avail himself of the values that television has found in immediacy and spontaneity?

a) Spontaneity Applied to the Stage.--First, what are the factors that contribute to the spontaneity of the tele-vision show? One is the audience knowledge that the performance is live and unrehearsed. Second is the structure that enforces conflict. Third is an unknown conclusion that is built to by suspense. Fourth is the fact of people appearing as themselves, not as actors portraying characters.

All of these factors make the live show a real life event instead of a fictional story. To follow the television lead, the stage director needs to experiment with making the stage play a real life event.

Toward that end, the stage is already familiar with the semi-scripted form of commedia dell'arte; a revision of some of its techniques exist today in the Broadway performances of a Bea Lillie or a Mike Nicols and Elaine May. Even certain method actors vary their timing, thoughts, actions, and even lines from night to night to keep performances fresh. However, there is still a wide gulf between the improvisational stage show and the spontaneous television show.

One of the chief obstacles to spontaneity in the stage play is its fictional nature; events are being enacted, not lived. When an actor, rather than his character, is in danger, changes the script, or talks to an audience, the frame of the stage is broken and the illusion with it. The fictional character disappears and the actor emerges. In other words, the audience predisposition toward psychical distance militates against extreme spontaneity, and immediacy as well, and of course stage spontaneity is useless unless it is known to be spontaneous; the audience will believe it is rehearsed. Perhaps the stage needs a new form in order to gain the spontaneity of the live television show.

b) <u>Immediacy Applied to the Stage</u>.--Many theatre experiments in immediacy have been performed, but somehow

they remain the exceptional productions; they are the oddities whose form never seems to become popular. It is this study's surmise that an audience generally dislikes the forced breaking of psychical or aesthetic distance through immediacy, as well as through spontaneity; they do not seem to like an illusion broken by an actor either addressing them or being in their midst. If in a particular play, or method of production, the audience does like the effect of immediacy, they are probably beginning to react to the performer and not to either the character he is portraying or to the situation of the play. Either that or the immediacy effect is accepted as part of an illusion and ceases to be immediate or spontaneous. The director, it seems, is rarely successful in having both audience involvement in an illusion and the effect of a real life event.

Two reasonably successful experiments in immediacy are Waiting for Lefty and The Night of January 16th. The latter aims for both immediacy and spontaneity but usually achieves status as a curiosity. The play uses a jury made up of audience members who each night have to bring in a verdict in a trial. Even with this amount of uncertain outcome and direct involvement, however, the audience knows the basic play is not changed and that two endings have been written to account for either verdict. It is a kind of game where the audience role is ambiguous. They really don't change the progress of the play and yet they are asked to pretend

they do. They are not quite audience and not quite performer; however, it seems the experiment deserves modification and repetition until its principles of immediacy and spontaneity for the stage can be clarified.

In the case of Waiting for Lefty the audience is drawn into the plot through being addressed directly by the players and by having players in their midst. Players on stage address the audience as if they were in a union meeting; players in the audience respond to the stage as if they really were in the union meeting.

Reactions to the play's immediacy effects have been quite varied all the way from reports of complete involvement to reports of complete alienation. However, this study feels that the form of Waiting for Lefty expects too much of its audience; it expects them to change roles in the middle of the production. Sometimes the audience is watching an intimate scene in a house, something they could not realistically expect to see and overhear; they are at such a point a conventional proscenium audience. Suddenly they are participants; their privacy as onlookers is invaded and they are expected to react to people in a wholly new way, not as part of an illusion but as part of a meeting in which they are participants. Yet at the same time the audience realizes it should not respond by speaking out in the meeting. In other words, the play forces involvement and withholds ultimate participation. The split is more

than a director should reasonably expect from his audience.

Other forms such as arena theatre, theatre on all four sides of an audience, or theatre in the audience have also been tried with mixed success. It would appear to this study that none of them quite achieve the spontaneity or immediacy of live television, primarily because the audience knows of the production's pre-planned nature and quickly accepts the new conventions in order to maintain appropriate aesthetic distance. Possibly the only way to achieve an effect on stage similar to live television is to have a carefully structured production whose details throughout are dependent upon the improvisation of actor and audience, a production whose ending is deliberately in doubt even to the performers, performers who are playing themselves in a battle of dramatic wit. In other words, perhaps the theatre could gain some of the advantages of live television by a special contemporary version of Commedia dell'Arte.

D. Relationship Between Sight and Sound on the Screen: Adapted to the Stage

Highly sophisticated relationships between sight and sound have been developed by the screen media, relationships which can suggest both direct and analogical adaptations to the stage. What seems to account for the sophistication is a combination of the precision possible when a production can be set in plastic and the unique historical backgrounds of the media.

The sound film can perhaps give the stage director a unique view of movement because of its background in the silent film. When the film makers were without sound they had to discover what meanings could be conveyed almost exclusively with movement. They developed special insights into filmic movement thereby. Conversely, television, with its origin in radio, already knew what sound alone could do. It had developed audio communication to a high degree. The resulting observations from the two screen media, after having combined their specialties to use both sight and sound, can add a special dimension to the stage, the medium which has always been able to take both sight and sound for granted.

1. Some Relationships Between Sight and Sound Suggested by the Screen Media

Generally, the old guard film theorists, remembering the silent film with pleasure, draw attention to the tendency of sight and sound together being in conflict or competition with each other. At least one or the other is usually supposed to be superfluous. The assumption is that either sight or sound has its own special language as a pure art form. Neither needs the use of the other. The isolationist and reactionary view is only useful to this study, however, to challenge the director to discover the strength of, and to perfect both his pictorial and his sound techniques and to find how they can best be integrated

into a sound and sight medium. Also, the director needs to find ways of keeping the sight and sound, as Arnheim puts it, from "fighting each other for attention."[9]

a) Relationship of Parallelism and Hierarchy.--Arnheim proposes a parallelism and a hierarchy for the relationship of sight and sound. He maintains that both the dialogue and the picture story must be complete, that one cannot substitute for the other since they are different media.[10] His labelling sight and sound as different media recalls that Arnheim tends to think of sound film as the combination of film and recording, and not yet a single integrated medium. His solution is to advocate a complete movement script coupled to a complete verbal script such that each tells the story in its own way.[11] He adds that one should dominate the other, and they should complete each other by dealing with the same subject differently.[12] In effect he maintains that there is a hierarchy of media in any work of art and for film the image, the picture, is dominant while the dialogue is recessive.[13] He feels, like many film theorists, that the reverse is true on stage; that, for example, Shakespeare and Moliere are complete without movement.[14]

---

[9]Rudolphe Arnheim, Film as Art (Berkeley: University of California Press), 1957), p. 199.

[10]Ibid., p. 208.

[11]Ibid., p. 211.

[12]Ibid., p. 216.

[13]Ibid., p. 224.

[14]Ibid., p. 221.

There may be some justification for saying that Shakespeare is complete without movement; certainly many literary theorists have so maintained, though this study disagrees. Certainly in the case of Moliere, who wrote using the traditions of elaborate stage business of both the French Farce and the Commedia dell'Arte, in many cases seemingly presupposing specific bits of comedy business, it seems Arnheim is mistaken. In any case, it seems to this study that the stage can profit more from Arnheim by treating the stage the way Arnheim describes the screen than by accepting his evaluation of the stage.

Arnheim's theory of parallelism for the screen has a certain importance to the stage director in suggesting that movement does not nearly occupy the prominance it ought to on stage since, as a general rule, sight draws so much more concentrated attention than sound. His challenge adapted to the stage director seems to be to experiment with the stage as a visual art; to see if stage can make anything like the screen impact by also making the picture dominant.

b) <u>Relationship of Alternating Balance</u>.--Bettinger supplies an alternate to Arnheim's Parallelism theory. He refers to it as the "attention balance"; "the mind can concentrate only on one thing at a time"; therefore, attention must be switched back and forth between sight and sound, because attention cannot effectively be maintained on both at once.[15] His relationship, in summary, calls for

---

[15]Bettinger, <u>op</u>. <u>cit</u>., p. 14.

restraining the dialogue when the impact is carried by the visual and the reverse when the impact is carried by the dialogue. He allows that for a brief moment of climax, possibly, both sight and sound may be accented.

Bettinger maintains that sound is more effective than sight in stimulating imagination but visual memory and believability are stronger than aural.[16] His point, however, only seems to suggest to this study that the more abstract a representation, or the less content it has, the more the imagination is stimulated; sounds conjure up visual images in the mind. This study is not opposed to stimulating the imagination; however, the study is more directly concerned with the attempt to communicate specific meanings, hence with the designed visual picture which is the image itself and is director controlled. When actually presented on stage the image is the same for the whole audience; the audience's mental image obviously varies according to the background of the individual audience member.

However, one positive point that Bettinger's ideas suggest to this study is for the stage director to consider adding a sound track to his play script, a sound track more elaborate than merely the required doorbell or fire siren, but a complete effects track, possibly with almost continuous music as a stimulant for audience imagination.

---

[16]Ibid., p. 18.

Such a track could easily supply the larger context, geographical or emotional, in which the smaller play exists. The play might even float in a pool of sound, including the ambient sound that would be present if the stage set were really in its larger context, sound that is, however, orchestrated with the movement and dialogue. Of course the screen technique would require a degree of synchronization and precise relationship between sound and dialogue that is more than most live actors can achieve. Ultimately, as with the music in a musical production, the director would probably have to decide whether the actor or the sound track would lead.

c) <u>Parallelism vs. Attention Balance</u>.--In the main, this study prefers Bettinger's attention balance relationship over Arnheim's parallelism. It seems that picture and sound may express different things, or the same thing in different ways, but that for both to be expressing a complete story in parallel may well result in a ponderous redundancy. To avoid the redundancy, at times the sound can be dominant, at times the sight, at times one or the other need express practically nothing, even be missing. In other words, sight and sound seem most capable of providing a variety of expression in a combination of contrasting with or supporting each other, and in waves of dominant and recessive relationship.

d) <u>Relationship of Sight and Sound Analogous to a</u> <u>Montage</u>.--The relationship of sight to sound described above finds a parallel in the montage. For the stage, perhaps one of the most effective translations of that mon- tage is the juxtaposition of movement and speech to create patterns of meaning. Where a movement fundamentally tells the same story as the dialogue there is a support, or a cumulative montage. Where the movement tells a contrasting story there is a dynamic, or dialectical, version of the cumulative montage.

Such stage montages may present both sight and sound simultaneously, but Bettinger's advice appears to be best. If sight and sound impacts are alternated, they can each have an effect without clouding the other. In practice, both sight and sound continue in a flow, parallel in a way, but the element making the point takes dominance at any one moment. Such a sight and sound sequence may reflect a chase sequence (simultaneous montage), a normal time sequence (a continuity montage), or a contrasting sequence (the dia- lectical cumulative montage) all to good effect.

e) <u>Sight as a Commentary Upon Sound</u>.--Usually the script words are thought of as providing the commentary and the context that clarify the meaning of movement. One example that reverses that relationship, where sight comments on sound, should hold special interest for the stage director; it is what Pudovkin calls "unsynchronized

speech"[17] and what Reisz means when he says "it is frequently more important to show a reaction than the speaker."[18]
In effect, the screen technique is to place the listening character on the screen while the speaker is temporarily either out of the frame or has his back to the camera. The technique can accomplish several things the stage director may use. It helps continuity by bringing the reacting character prominently into the scene before he speaks; that is, it provides an overlap. On stage, this overlap could be one of position; for example, the reacting character has his face to the audience, the speaker his back. The overlap could be one of movement; for example, the reacting character starts a gesture or turn to gain focus before the speaker has finished talking. In other words, the stage director can break the general rule (which is to keep the speaker in focus and to allow movement only from the speaker) in order to present a vital reversal. A montage-like contrast will result between the speaker and the listener, a more dynamic interrelationship of sight and sound, than the mere alternation of attention.

2. Special Relationships Between Sight and Sound on Stage

There are certain relationships between sight and sound on stage that the screen director may help the stage director to clarify and to turn to his advantage. One of those is the necessity for simultaneous effects on stage, and another is the probable dominance of sight on stage in spite of the prominence of the script lines.

a) Sight Congruent with Sound.--Although both stage and screen directors may advise one thing at a time, usually on stage one thing does not occur at a time. In a screen montage, often one thing does because of the selectivity of the camera; on stage there is usually a relationship of dominant and recessive with many things happening at once, including both in sight and in sound. The point to be made is this: even though an audience may only concentrate on one thing at a time the audience is quickly aware of discrepancies around the point of concentration. Although the audience is listening at a given moment, the sight factors need to be congruent with, or obviously in contrast with, the sound. Peripheral vision and its aural counterpart both exist. If they did not, the director would find it difficult to redirect attention away from an old focus and toward a new one; a movement or sound elsewhere in the audience's field of vision or hearing could not serve to control a change of audience focus. The only instrument of redirecting attention would be the object in focus itself. Since peripheral awareness does exist, the

stage director needs to supply enough movement and sound around the point of focus so the audience realizes the focus has a context. At the same time he needs to allow no sound or movement of a speed or a magnitude to distract the audience until the director desires a transition.

b) <u>Sight Dominant Over Sound</u>.--Because screen movement is so prominent much attention has been paid to what kind it is. Arnheim, and others, have observed that the variety of pantomime that usually accompanies screen dialogue is insufficient, unexpressive, and monotonous. The arms and head usually beat time to the rhythm of the dialogue, but the movements contribute little more to the scene than a punctuation or an emphasis.[19] His suggestion is to re-place the man who talks with the man who acts. Bettinger supports this view by suggesting limits to the screen dialogue. Dialogue should convey only the minimum informa-tion necessary for exposition and characterization. The screen image should do the rest.[20] Curran supports the opinion further by proclaiming that the screen reaches its greatest heights as a medium of pantomimic expression; dialogue ought to be kept to a minimum.[21] Herein is another

[20]Bettinger, <u>op</u>. <u>cit</u>., p. 76.

[21]Charles W. Curran, <u>Screen Writing and Production Technique</u> (New York: Hastings House, 1958), p. 21.

challenge to the stage director. Need the play script be so wordy? Can't the visual on the stage have almost as much prominence as the visual on the screen?

Although the pantomimists and dancers will reveal to this study additional insight into what movement with few or no words can mean, the film can lead the way in suggesting fruitful relationships between sight and sound where sound is still important but sight is predominate. Indeed, perhaps the dominance may already be as true for the stage as Stasheff maintains it is for television. When scripts, whose main interest was verbal, were adapted to television Stasheff says that a strange reversal took place; the picture became prominent.[22] Possibly the same relationship is true on stage whether or not the director knows or wants it. If so, then the director might well take advantage of this prominence and not let it do trivial things or suppress it in favor of the less impressive words.

E. Summary Conclusion: Screen's Challenge

to the Stage Director

The conclusion of this chapter consists of two suggestions to the Stage director. They are to use the analogical method of adapting Screen techniques to the stage, and to adopt the screen's creative directing role.

---

[22]Edward Stasheff and Rudy Bretz, The Television Program, Its Writing, Direction, and Production (New York: A.A. Wyn, Inc., 1951), p. 24.

1. Challenge of Analogy

By the method of analogy the stage director can borrow creatively and imaginatively from the screen. He can start by letting the audience substitute for the camera, the scenery for the horizon, or anything substitute for anything else in moving relationships until some new idea occurs to him that may be fruitful. In the process he may adapt to the stage screen techniques, larger screen principles, or merely small screen idiosyncrasies. For examples, he may use the large principle of the free manipulation of time and space all the way to merely the results of an early imperfect motion picture projector. The possibilities are unlimited for the imaginative director. All he needs is a knowledge of the techniques and principles of the two screen media, a few methods of abstraction, and the desire to experiment.

2. Challenge of Creativity

The desire to experiment is perhaps the director's biggest asset in relating film to stage; for a special challenge to be creative by analogy and by example is clearly implied in this entire chapter. But perhaps more than the screen techniques themselves, or even a method of adaptation, the stage director needs the point of view and the creative freedom of the screen director. And to use that freedom, he also needs a thorough knowledge of his own medium to fulfill the responsibility that the freedom

implies. The chief freedom the screen director has is the emancipated view that the written script is only a scenario, a skeleton which he must dress. The scenario is usually not considered a work of art, but a story line from which a plan, a shooting script, derives and from which a work of art hopefully will emerge.

The stage director on Broadway, or wherever original scripts are produced, often feels as does the director of film. The script is incomplete; it needs rewriting and testing. The stage director can aid not only in interpreting but in creating both the script and the visual production. Such freedom to create must be assumed by a stage director, both with original scripts and with those scripts which were original dozens or hundreds of years ago, before they too had undergone testing, otherwise he can never be anything but tied to the decisions of other artists.

Specifically, as Tyler suggests, the director should look through his script to "translate his feelings into images as though the words did not exist."[23] Not because the stage director must become filmic, but because the filmic idea will add one more powerful string to the director's bow. He should look for places to interpret

---

[23]Parker Tyler, The Three Faces of the Film (New York: Thomas Yoseloff, 1960), p. 57.

feelings visually, places for pantomime scenes, places for
montage bridges, places for fully orchestrated sound effects
and musical backgrounds, places where special points of
view or distortions are possible through character identi-
fication, places where people and ideas may be freshly
presented by alternating relevation and concealment, and
places where the depth and scale of pictures can be changed
by application of filmic concepts. In short, perhaps the
stage director should be more daring than an interpreter;
he should seriously consider being an originator, looking
for places where he can originate not only pictorial but
also verbal script in order to provide for stronger pictorial
representation. In order to avail himself of bolder and more
expressive movement techniques a director needs to be at
least a play doctor if not an actual playwright. He needs
not only to be aware of the potential for movement on stage
but to be able to provide himself with the script framework
that will help him to realize that potential.

CHAPTER VII

MOVEMENT WITHOUT SPEECH: CERTAIN PRINCIPLES OF

DANCE, PANTOMIME, AND PSYCHOLOGY

ADAPTED TO STAGE PLAY MOVEMENT

A. Introduction: Special Contributions of Pantomime

and Dance to Dramatic Movement:

from The Theatre and Life

Even as with the silent film makers, the dancers and
pantomimists have special light to throw on the meaning of
stage movement because of their reliance on theatrical
movement without speech. When movement is presented by
itself, divorced from words, a language of movement takes
on much greater importance. Without a verbal context to
explain the meaning of a movement, the dancer or pantomimist
must depend upon the movement pattern to supply a meaning
context, and upon each individual move to contribute to
that context as well as to supply specific individual
meanings.

Many of the principles and techniques of movement in
both dance and pantomime draw from the same theatre heritage
as the play. Much is held in common by all three art forms
They use the same stage, the same audiences, and seek
similar goals of expression, communication, and entertain-
ment.

All three forms also draw directly from an observation of life, partially from the psychological and physiological aspects of body movement and motivation but also from movement that has been learned in cultural life. Consequently similar conventions and principles are practiced by all three forms. This chapter is concerned primarily, therefore, with what the pantomimist and dancer can add from their interpretation of theatre and life to what has already been accumulated in this study.

1. Theatre's Contribution: Conventional Language

Because of dance and pantomime's need to communicate with movement alone they have adapted theatre's movement heritage in more complete and special ways than has the stage play. Conventions of stage areas, the meaning of abstractions, the use of metaphors, and the stage stereotypes of emotion and attitude have all been explored in greater depth. The peripheral aspects of stage movement, such as rhythm and tempo, have become central and powerful. The size and shape of movements have become enlarged, simplified, and more explicit because there is no verbal context to clarify their meanings. Hopefully the stage director can benefit from the deeper and broader search into the common theatrical movement heritage.

2. Life's Contribution: Human Behavior

This study is also interested in dance and pantomime's

sources in their observations of life, largely because both art forms maintain a partial dependence upon these observations. From the beginnings in Delsarte both forms have maintained some dependence upon clinical observation of behavior and the meanings behavior apparently has, that is, observation of the real life situations to which that behavior seems appropriate.

The psychologist is of interest in this chapter, partially, then, to the extent that he may support or counteract the specific claims of the pantomimists and dancers concerning the meaning of body movement; but perhaps even more the psychologist is of interest to the extent that he can clarify the source of the pantomimist's body language. Psychology is to the meaning of body movement, after all, like the study of etymology is to the verbal language. The origins of the verbal language help to explain its meanings, but the language now has taken on certain meanings through usage apart from its origins. So it is with pantomime and dance. The backgrounds are of interest, but can neither affirm nor deny the current cultural meanings of movement. They may, however, suggest ways to help modify or enrich the current modes. The psychologist is not brought into this chapter for the purpose of testing what is communicated by the movement language to an audience. This approach is beyond the scope of the present study, even if such specific tests were available. The experience of this study is that

most available related investigations do not bear directly upon the problems at issue in this study; the investigations would have to be related analogically and hence would loose their scientific authority in the application. It is the opinion of this study that special tests would have to be devised if psychological testing were the aim.

At any rate, the dancers and pantomimists are primarily dependent upon studies of behavior in real life contexts, studies conducted by Delsarte over half a century ago, studies that did not separate out the psychological, physiological, or cultural bases from the observed movement forms. So that movement drawn from observed life, rather than from psychology in particular, is the second main source for pantomime and dance's movement meanings, while the testing of the language currently used by those arts, to see what is communicated, is the subject of another study.

3. Order of Presentation: From Gross to Fine

It is the job of this chapter to combine the concepts and observations of those concerned with the meaning of movement as movement is divorced from words in order to garner for the stage director whatever may be useful in his art. To be consistent with the rest of this study the material will be presented in order from gross to fine movement. The imitations of life and the theatrical conventions will be discussed simultaneously as they become appropriate to the discussion of gross and fine movement.

The choreographer is the artist in this chapter most corresponding with the stage director and most concerned with the meanings of the gross movement in blocking. The choreographer's view of the use of the abstract elements of mass, line, form, balance, emphasis, and rhythm will contribute new insights to the stage director's use of composition and picturization.

The section on fine movement will be divided into the same movement divisions this study used in Part I: Mimesis, metaphor, and symbol. The mimetic basis for dance and pantomime is drawn in part from certain psychological principles, in part from Delsarte's views of natural movement meaning as classified into a language, and in part from the direct observations of life made by the dancer's and pantomimists. The metaphorical and symbolic basis for movement meaning in this chapter derives almost entirely from the use of theatrical convention and stereotyped behavior as used by the dancers.

4. Movement as Expression or Communication in Dance and Pantomime

There are many schools of thought amongst dancers and pantomimists as to what the role of movement should be. Some feel movement should merely express the feelings of the mover with no necessity to communicate to an audience. There are those who insist that dance exists for its own sake and not for communication. Their view will be discussed;

however, strictly speaking, their view falls outside the
realm of the meaning of movement. The majority, however,
consider movement as a method of communication.

The practitioners and theorists herein consulted con-
cern themselves with meaning, that is with derivation of
stage movement from natural behavior, from moving objects
in life beyond the stage, and from culturally symbolic
languages that have grown out of stage practice. There
are those who insist there is a universal language of the
body, with a definite body movement or position correspond-
int to each feeling or attitude, and those who maintain that
only a very general emotional mood can be conveyed by natural
body movement. Still others have an eclectic point of view
and suggest combining observation, abstractions from nature,
metaphor, symbol, psychological principles, and established
theatrical conventions into a more or less integrated
system. The latter course is the one this study will
suggest for the stage in more detail at the conclusion of
the chapter.

B. Gross Movement Composition Elements
Interpreted By the Choreographer

When the choreographer plots group movement he employs
gross composition principles that are very similar to those
the stage director uses in the gross blocking of his play.
Because of the similarity much of the choreographers art

needs little translation to be used by the director. In-
deed, because of the media's common heritage much that
both artists use has already been discussed fully in the
first part of this study. It remains here to collect what
additional principles and techniques the choreographers
have to suggest.

Both Hayes and Humphries cover the compositional
principles of group movement quite completely and concisely.
They include mass, line, form and balance, emphasis, and
rhythm. However, certain special aspects of some of the
above elements emerge that might be useful to the stage
director.

1. Mass Considered as Density

Mass has been previously defined by this study as the
appearance of weight; it can also be considered as the
appearance of density. The idea of density is really a
poetic image with an analogical basis. Hayes employs the
image to suggest a special quality of group movement on
stage. The term density derives from physics. The density
of the medium (air) through which the dancers move, deter-
mines certain qualities of movement.[1] To try to apply the
idea, if the air is thought of as being more dense than
normal, even as dense as water, the dancer moves in a sort

---

[1] Elizabeth R. Hayes, Dance Composition and Production
(New York, 1955), p. 46.

of slow motion. However, the slow motion is distinct from the filmic variety. A motion occurs that is slow because it appears to be overcoming opposition. On the other hand the air could be thought of as having no density and movement becomes rapid and flitting. Coupled with analogical variants on other physical laws, such as gravity, density of movement can suggest a great deal toward setting the overall mood of a play.

2. Line Considered as Abstraction and Textural Dynamic

Line has also been discussed at length in the first part of this study; however, Humphries has some interesting additional comments on some of the connotations of line patterns in opposition. Opposed lines suggest *force*, *energy*, and *vitality*, whereas successional lines that flow or curve suggest grace and languor.[2] Her special point is that opposed lines seem to hold in, or retain, energy while unopposed lines of movement allow for energy loss from the body.[3] Her way of expressing herself sounds at first rather mystical, but there is an important principle involved. A sympathetic illustration would be this: if an actor moves up against another actor, or his line of march is cut off by

---

[2]Doris Humphries, *The Art of Making Dances* (New York: 1959), p. 57.

[3]*Ibid.*, p. 58.

another's line of march, his movement comes to a halt, or
at least his line pattern stops abruptly. This stopping
gives the audience an impression something like that of
water being held back by a dam, or of a sentence being
held in by a period. The movement is restricted, enclosed,
and hence retains its energy. If the movement simply flows
unimpeded, it is like the stream without the dam; water
flows away and is lost. The impression of force is not
present until that force is opposed. Or, to change the
metaphor, the unopposed movement is like the sentence that
ends with a series of dashes. It is weak; energy seems
to escape with a sigh at its conclusion. As this chapter
continues it can be seen that many of the choreographers'
abstract compositional elements, like the above, have a
metaphorical basis.

Line can also be considered in terms of the shapes and
patterns it forms that will give a certain dynamic impression
to certain movement textures. Dynamics for Humphries
include what she calls variables in texture.[4] Texture it-
self is also a concept that seems to be more analogical
than literal. In materials, such as fabric, texture refers
to such qualities as smooth and rough. In movement, texture
refers to similar qualities such as angular, sharp, circular,
and smooth, but also to gradations in tension. These com-
positional components are expressed by various parts of the

---

[4]Ibid., p. 97.

body. Sharpness is usually conveyed by small movements of knee and elbow, while smoothness is expressed by the large muscles of arm and leg propelling the whole body in space. The meaning of these textural variations is closely associated with the meaning of abstract line patterns. The sharp and angular are supposed to be stimulating, while the smooth are supposed to be soothing. Humphries combines two dynamics to form a contrapuntal effect; an example would be for one arm to move sharply while another is moving smoothly.[5] She notes that the Spanish dance uses simultaneous dynamics; sharp foot movements combine with smooth arm movements.

How may the stage director use dynamics in his movement? Direct adoption is, of course, quite possible. Actors can aid their characterizations by using textures that show emotional qualities or attitudes. The director can create an underlying mood to a scene by these same textures of movement. However, simultaneous dynamics provide the most exciting possibilities. Any part of a scene, or of a human body, that contrasts with another part affords fine opportunity for directoral comment on the scene. Two moving elements are apt to be more noticeably contrasted than one moving (the actor) and one static (the scenery). The director needs only to decide what two moving elements will best express the two different textures of

_____

[5]_Ibid._, p. 101.

movement. The two dynamics, or textures, may occur within the same actor. For example, two dynamics may help to provide a revelation of a hidden facet of his character's personality. A smoothly moving torso and head with fidgeting hands and elbows behind the back can reveal a surface calm with an underlying tension. One arm gently enfolding a young lady while the other arm is nervously reaching for a wallet, can suggest a conscious effort to be suave with a hidden fear of not being able to pay the bill. Or, in such a stylized form as Gilbert and Sullivan, a director may support the author's comments with less realistic simultaneous dynamics. The upper part of the actors' bodies can be carried proudly erect, in a smooth flowing static symbol for ego and breeding. Meanwhile the feet can be moved in an almost acrobatic fashion, in a satirical comment on the upper part of the body. The impression is almost of two bodies in one, as if a mischievious bottom man were carrying around on his shoulders, and ridiculing, a pompous top man.

3. Form and Balance Considered as Abstraction and Image

Generally, Humphries considers balance as a property of form rather than as a separate category. Balanced or unbalanced forms exist in many kinds; but there seem to be two general varieties as discussed by Humphries; there are forms that seem to derive mostly from compositional abstracts, and forms that more obviously derive from objects or ideas external to themselves. In other words, there are abstract

form and analogical form. The abstract formal elements of new interest to this study are symmetry and linear two dimensionality.

To Humphries, symmetrical compositions have the same stability, repose, and harmony that they do for stage directors. She does, however, mention a unique set of uses for the form. Symmetry can be employed prior to or after the operation of will and desire; it can also be used for conclusions.[6]

The stimulus her suggestion offers to the director's imagination can be far reaching. Symmetry followed by asymmetry followed by symmetry may well help to interpret a scene that should start calm, become excited, and end calm.

Balance, unbalance, then balance might be added to the same sequence. Smooth, angular, then smooth might also be used. To avoid redundance, and to allow for some anticipation of the middle phase, asymmetry, perhaps an opposition sequence would match better than a supporting one. Such a sequence could start with rough texture matched with symmetrical balance, followed by smooth texture matched with asymmetrical balance, as passion operates and overcomes its opposition, and completed by the repose of symmetry and the equal repose of an even smoother texture.

---

[6]Ibid., p. 160.

Humphries' linear two dimensional composition is useful, she maintains, only for ritual, impersonal, and cold sequences. At all other times linear two dimensional compositions are too devitalizing, lifeless, monotonous, and inhuman.[7] Here her observations are not so new to the study as they are more specific, and specificity is usually what stage directors most lack. It seems the need to find out how to apply principles may be more pressing than the need for more principles.

Form in its aspects of complexity and simplicity receives additional attention from the choreographer. Humphries says that "the solo instrument can be quite elaborate," as it "has the sole responsibility of expressing the total group movement".[8] On the other hand, the larger the group, the simpler each individual should be. For the total grouping will still be more complex than the most complex, single individual alone on stage. In effect, no element in a group should be complete in itself; only the whole composition should be complete. When music, costume, and lights are added to all the movements, the stage picture should be complete, but not before. The stage director can learn a great deal from this formal principle. In realistic theatre the director often tends to be Victorian. Every realistic detail is often present in costume, gesture,

---

[7]Ibid., p. 160.   [8]Ibid., p. 61.

property, and scene. The result is an interesting museum
piece around which the audience eye may at first wander
fascinated. The result, though a unity of style, is not
a unity of production. The whole may fall apart if each
part is a whole. In effect, the suggestion for the director
is to use selective realism especially applied in relation
to the number of characters and scenic elements on stage.

Form is also considered by Humphries in terms of its
metaphorical sources. She notes that early modern dancers
abstracted their forms from as wide a variety of objects as
buildings, people, dynamic relationships, trees, and
machinery.[9] There seemed to be interest primarily in seeing
just what could be expressed with movement, what could be
done by the new medium. Such forms are still expressed, but
more and more the theme dominates the form. Humphries suggests
starting to look for themes and formal elements by being
attuned to the spirit of the times. To her this century is
symbolized formally by the right angle.[10] She maintains
that a keen observer of his life and times will find an
"inevitable relationship between the accumulated store of
visual and mental attitudes dominant in our age, and
composition.[11] Among these compositional principles
Humphries derives, such as the right angle, is the demo-
cratic grouping. The latter she likens to the Greek chorus,
wherein the group is important as a group, and also as

---

[9]Ibid., p. 22.   [10]Ibid., p. 29.   [11]Ibid., p. 20.

individuals.[12]

Her decision about what is the spirit of the times is perhaps not so important to the stage director as her method. By comparing ideas, concepts, architectural shapes, or typical styles of a particular time, or play, a director can derive images and forms that can be depicted in movement.

4. Emphasis Considered as a Function of Stage Space

In the emphatic use and meaning of stage space Humphries fundamentally agrees with the findings of the stage directors. She also adds some interesting observations in the categories of direction of movement and area strength.

a) Direction of Movement.--Humphries maintains the most powerful movement on stage is straight forward, next is diagonal, and third is circular; the circular gives the audience a sense of continuity, but because the body line keeps changing the body gives a weaker impression.[13] "Straight forward" needs some explanation; Humphries is not explicit. It seems that straight toward the audience would be the strongest move, diagonally across the stage the next. However, the stage director can make another fruitful combination here with the principle of character-audience

_____

[12]Ibid., p. 91.　　　　[13]Ibid., p. 81.

identification. A straight move toward the identity char-
acter is also a strong move, the diagonal move in relation
to that same character can be somewhat weaker. If the
director uses the fact of audience-character identification
he may then strengthen or weaken any move in two ways.
This identification becomes more important in arena theatre
where there is no consistent "toward the audience" move.

b) Area Strength.--Humphries has an interesting
variation for dancers in the order of stage area strength.
To her, the order of strength is center, up right, up left,
down right, down left, up center, and down center.[14] Most
directors think of down center as the strongest area, and
generally center next; then the areas become weaker as they
fan out from the center. Humphries feels down center is weak-
est. She does not give a total rationale for her order, but
some of her observations are enlightening. To her, up right
and up left are strong beginnings for movement: they are
supported by stage verticals (such as back drops or box set
corners) and the right angle support (intersecting corner
lines) of power and excitement.[15] From these corners the
diagonal is the strong move. The move becomes weaker as it
approaches the center, strongest at the center, and then
weaker again until it attains some support from the vertical
lines at the down stage corner.[16]

---

[14]Ibid., p. 83.   [15]Ibid., p. 70. [16]Ibid., p. 75.

There seem to be two weak points in Humphries observations. First, in the stage play there may be no strong supporting scenic verticals at the corners, and , second, possibly a support weakens the body rather than strengthens it. By the principle of contrast, the body should be stronger if it provides a contrast, not a concurrence, with its background. Humphries does not express an opinion of area strengths when there are no verticals in the setting, nor does she seem to reconcile her views on contrast and support.

It seems to this study that Humphries is mistaking strength for potential. At the center of the stage the actor controls the situation and can move in any direction. At the upstage corners the actor has high potential to move into strong areas and to make strong moves. At down stage center the strong move is at an end and can go no further. There is no potential left. However, lack of potential is brought about because the actor is already in the strongest area.

5. Rhythm Considered as A Natural and A Musical Organizer

Rhythm, established by repeated elements in movement, is considered by Humphries to be "the great organizer"; its natural sources, from which to abstract in order to decide which rhythm will be used, are, first, the breathing, speaking, singing apparatus which leads to the rhythms of the phrase; they are second, the semi-conscious rhythms of

the heart beat, peristalsis, contraction-relaxation of
muscles, and waves of sensation from the nerve endings; third,
they are the movement of the legs in alternate steps; and,
fourth, they are the emotional rhythms of passion, or the surge
and ebb of feeling.[17] The source list provides a director
with natural rhythms he may use with empathic power. Not
all of these sources are in regular use by the stage
director, but through them he can attune a performance to
the feelings of his audience.

Hayes draws attention to the rhythms derived from
music. These, combined, form cumulative, simultaneous,
and resultant meters; these are combinations of rhythms to
provide more complex rhythms.[18] Music as a metaphor, or
direct use of musical rhythms, can suggest ways in which
natural rhythms may be combined into formal unity. However,
the more the director draws upon music as his rhythmic
source, the more abstract and remote from meaning becomes
his communication, since the movement is twice removed from
its original source; music derives its rhythm from life and
movement derives its rhythm from music. The more the director
uses natural rhythms directly, the better chance he has to
produce a controlled empathic response.

The phrase is one natural rhythmic unit of organization.
The phrase originates according to Humphries from the length

---

[17]Ibid., p. 105.   [18]Hayes, op. cit., p. 76.

of a breath when a person speaks or exhales. The breath
phrase dominates dance movement as it is an easily com-
prehended length of stress. A phrase consists of an
expenditure of energy followed by a rest, or a tension and
relaxation sequence, or a sequence of punctuations of
energy.[19] The phrase as a unit of rhythm, according to
Humphries, is essential in order to maintain the shape of
nature. Without the phrase, attention has no focus and
movement becomes exhausting for the audience. Too quick
punctuation in phrasing can also be tedious. It is pre-
sumed by this study that audience empathy with the tedious
rhythm would bring about the audience exhaustion. Without
a periodic rest, or with too rapid a pace, audience exhaustion
may take place.

The basic pattern of Humphries' phrasing is Aristotelian,
consisting of a beginning, middle, and end, followed by a
slight hesitation or rest. An accent may come in either
part, depending on the connotation desired for the rhythm.[20]
The phrase may also be fragmented into clauses, phrases, and
punctuation that add up to a small unit of meaning, even as
does the sentence.

Repetition in rhythm has a special significance for
dance because of the necessity to establish a rhythm in
some relationship to the repeating rhythm of music.[21]

---

[19]Humphries, op. cit., p. 66.   [20]Ibid., p. 68.

[21]Hayes, op. cit., p. 13.

Repetition is, in fact, usually shunned by the realistic director, or else allowed to be tedious through oversight, to the detriment of his play. Controlled repetition of formal elements in movement not only helps to establish a rhythm but combined with variety of expression and with recurring groups of movements it helps to provide increasing tempo, complication, excitement, and climax. Without repetition of formal elements there would be no comparison of an early occurrence with a later occurrence in order to perceive increases.

Tempo, the speed of rhythm, is calculated on stage, Humphries notes, as a variation of the speed of a normal walk.[22] If a person moves faster than a normal walk the tempo is felt to be fast, if slower his tempo is felt to be slow. Her observation gives rise to some other conjectures. Normal breathing, heart beat, or phrasing rates may also establish norms for tempo depending on the context of the tempo. Her important point, however, is that the established, normal, regular tempo is neutral; it is too dull to arouse an audience. Faster, slower, or irregular tempi are needed to create interest or excitement.

C. Fine Movement Adapted from the Psychologist, the Pantomimist, and the Dancer: Movement of Individual People

---

[22]Humphries, op. cit., p. 108.

The choreographer's abstract elements of composition fit quite readily into the stage director's picturization vocabulary. When the meaning of movements as made by individual dancers and pantomimists is considered it does not appear to receive such general acceptance. The problem exists largely, it seems, because of strong claims for a psychological basis and a universal application of the movement principles. If the movements are considered as culturally derived and with meanings dependent partly on psychological behavior but largely upon a knowledge of the movement language, many of the problems abate.

1. Body Movement: Three Kinds Combined; Mimesis, Metaphor, Symbol

Body movement as described by authors in this chapter still follows the categories of mimesis, metaphor, and symbol. However, it is often difficult to discover what body movements are derived from which source. Even those that are mimetic may be an imitation not of universal psychological behavior but of culturally learned symbols for feelings and attitudes. Which body movements are reflexive, which natural to all human beings, which ones learned but highly typical of the culture, and which ones are symbolic conventions is not always easy to discover. It may be good for the director to know the difference in source in order to know principles for creating new meanings, but it is often quite unnecessary in order to communicate on the eclectic

American stage. Further, as long as the director understands accepted meanings and has principles of psychology, metaphor, and convention to derive new moves and meanings, the audience may receive a unified impression of meaning without the use of some single mode; the audience probably needn't even be conscious of which modes are being employed.

2. Mimetic Movement: Meaning Derived from Imitation of Natural Body Movement

The difficulty in correlating views of the meaning of body movement derived from human behavior is largely one of terminology. For this reason although there seems to emerge a relative agreement in principles and techniques, the agreement is difficult to evaluate as a whole. The most valuable agreement between views of artists and scientists comes with the observed behavior of human beings. The objective behavior when a man is under the influence of an emotion, expressing an attitude, or reacting to an expressed emotion or attitude is described by the artist and the scientist alike, and in quite similar ways. The divergences occur within the vocabulary used and within the overall classification of the objective phenomena. One man uses psychological jargon, another uses theological, mystical, or philosophical jargon. One groups his observations in terms of kinesthetic responses, neuromuscular sequences, or actions and reactions; while another groups his findings in threes

according to a trinitarian religious viewpoint, or spatially according to the part of the body affected by the movement. One speaks of inner motivation and outer stimulus forcing a neuromuscular reaction pattern; another speaks of the inner soul or purpose creating the outer form. However, if the compiler of ideas can discount the terminology and structure imposed on his observations by the artists' or psychologists' overview of life there is much that each can contribute to the stage director. Many of the divergences of view are more apparent than real.

a) A Psychological View of the Meaning of Body Movement: The Dancers' Interpretation of Psychological Principles Combined With Related Psychological Views.--The psychologist is in part a systematic observer of human behavior. As such his findings can be and have been of value to the director and choreographer who wish to communicate by the imitation of nature. A danger exists, however, in assuming that if it isn't proven by psychology it doesn't exist. Unfortunately, psychology has not yet undertaken very thorough studies of what movement means to an audience; hence most of the material available is the result of clinical study of clinical symptoms, not of mass communication by movement. Unfortunately, such material often uses terminology that is difficult to translate into theatre terms. For example, when the psychologist maintains that emotions all have the same symptoms, his observation is less than helpful for the

theatre man. The psychologist in this instance is not studying everything the theatre man needs to know, namely, the correspondence between body movement and attitudes, emotions, motivations, and learned overt responses. In other words, the theatre man needs to remember that not everything in human movement behavior is in the psychologist's domain.

The psychologist's study under laboratory conditions also tends to devaluate his conclusions for the theatre man to some extent. The very controls he needs in order to make valid tests often result in testing emotion under inhibiting conditions. The more overt symptoms, such as show up at the scene of a human disaster, are apt to disappear leaving only the subvert. His records may well show only emotion inhibited. Until testing is undertaken in the field, testing of normal human beings as they are moved by a real stimulus and are reacting spontaneously, as much as possible before their cultural inhibitions set in, will a complete and accurate survey be possible. So far, only Delsarte has undertaken such a survey, and his view was perhaps over colored by the 19th century.

Still another survey that needs taking is one of what audiences understand from stage movement symbols. How much is communicated to an audience by theatrical styles, as compared to the psychological symptoms of emotion and attitudes, may help to uncover some principles of effective symbols. So far no such a survey has been made.

Unfortunately, also, psychologists and those dancers and pantomimists who apply psychology do not always agree with each other any more than do stage directors. Each supposedly witnesses the same, or similar, sets of symptoms, but each is apt to put a different interpretation on his findings. The problem of the reversible process of the cause and effect of emotion is a case in point. 1-Empathy and Kinesthesia, Reversible Mechanisms in Communication by Body Movement. Mary Todd says, "Bodily postures definitely influence the emotions. Certainly the reverse is also true." She adds that "peculiarities of postures associated with mental diseases and abnormalities have long been observed,"[23] Her precept is, "we sit and walk as we think," "living, the whole body carries its meaning," "for every thought supported by feeling, there is a muscle change."[24] To her, "function preceded structure." "Everything moves, and in the pattern of movement life is objectified."[25] In these statements lie the basis for kinesthetics and empathy, most important concepts for the communication of feeling through body movement.

Just how the body and the emotions interrelate as applied to the dance is more carefully stated by Hayes.

---

[23]Mary Elsworth Todd, The Thinking Body (Boston: Charles T. Branford Company, 1949), p. 36.

[24]Ibid., p. 1.

[25]Ibid., p. 3.

Kinesthesis is the study of the movement of muscles as they provide sensations for recall, recall that is necessary for the individual to repeat a movement. Kinesthesia is sometimes called by method actors muscle or sense memory. Hayes points out that the state of mind associated with a move is also recalled along with the move.[26] In performance, she maintains, a dancer or actor produces a movement, and the audience reproduces the movement in its own body. In turn the audience feels or recalls whatever associative meanings each member has for that particular movement.[27] She cautions, however, that the audience may not have the same associative meaning for the move as the dancer has. Communications depends upon the degree of universality of the feeling and universality of the bodily expression of that feeling.[28]

It is well to note that several sources are in agreement concerning the kinesthetic and empathic process, Doctor Campbell from the psychiatric field, the only doctor this study could discover who has written recently on this particular subject. As has been seen already, Todd agrees in principle; Stebbins also has been shown to agree that the inner thought determines the outer form and the outer form tends to reinstate the inner

---

[26]Hayes, op. cit., p. 22.

[27]Ibid. [28]Ibid., p. 23.

response.[29] It remains to note that Douglas Gordon Campbell,

neurologist, psychologist, and psychiatrist, is equally

certain of the process. He states, "often our words

contradict our movements, symptoms, attitudes, posture, and

gesture, which can be read accurately if the code is known,

but will certainly register even without conscious

recognition."[30] To Campbell, obviously, movements have

definite meanings, meanings that may be in contradiction to

words spoken at the same time. It is equally obvious that

Campbell feels these meanings are specific enough to be

considered a language, if one knows how to read that lan-

guage. Unfortunately he does not supply the code. Perhaps

his most important idea, for the stage director, though, is

that these meanings will register with an audience even if

not consciously read and understood.

2. Verbal and Movement Communication Contrasted: Symbol

vs. Symptom. Here is where movement language differs from

verbal. Since verbal language consists only of symbols, a

lack of knowledge of those symbols renders the language un-

intelligible. Since the language of movement is at least

---

[29]Genevieve Stebbins, Delsarte System of Expression.
(6th ed. rev.; New York: Edgar S. Werner Publishing and
Supply Company, 1902), p. 141.

[30]Douglas Gordon Campbell, "Your Actions Speak so
Loudly," Impulse 1954 (San Francisco: Impulse Publications,
1954), p. 27.

part symptom, however, and these symptoms are conveyed by empathic means to an audience, and take on an associative meaning to that audience by kinesthetic means, movement conveys its meaning in part regardless of the intent of the director. The challenge here to the director is obvious. He needs to know how to read these symptoms and how to have his actors perform them if he wants control over his communication to the audience.

Campbell complicates the issue somewhat by suggesting that movement has two kinds of meaning. These are, first, conventional signs in culture, understood by an audience, and second, "subliminal" indications of true feelings; both may, he maintains, occur simultaneously.[31] The complication does not seem to affect the empathic process, however, for, as Kempf says, "a feeling consists in the autonomic reactions aroused by what the eye sees"[32] and what the audience eye sees in terms of muscle tension and relaxation, body position, and body movement, tends to be reinstated in its own body. If the movement symbol has generally understood meanings, then it will create emotional associations in the audience similar to those of the performer, just as readily as will the "subliminal" movement and meaning of innate and

---

[31]Ibid., p. 28.

[32]Edward J. Kempf, The Autonomic Functions and the Personality (New York: Nervous and Mental Disease Publishing Company, 1921), p. 4.

truly felt emotion. The converse can also be true, that "pure movement," being performed without connotational interest, will take on connotative meaning as empathetic tensions in the audience draw on its past experiences.[33] As Todd observes, "we copy postures of emotions and they become symbols again."[34] The audience and performer alike are usually unable to distinguish between the "subliminal" movement and the symbol that the culture has adopted for the feeling. Symptom and symbol alike have become natural.

3-Psychological Support for Contrapuntal Words and Movements. Campbell's assertion that emotional meanings of movement can be seen, or felt, to contradict verbal meanings, or even contradict other movement meanings, is a strong support for the director's natural use of a movement subscript. In the chapter on film this study suggests the artistic possibility of a montage of contrast, a dynamic dialectical montage, where the movement carries a meaning apart from the words. Campbell's findings support the psychological feasibility of the artistic device. One could only wish that Campbell would compile his language of movement so that all directors could read the symptoms. Probably if he did, however, he would be guilty of the same absolutism as Delsarte, and would soon fall into disrepute because of his over eager "popularizers."

---

[33]Hayes, op. cit., p. 91.

[34]Todd, op. cit., p. 2.

4-Retroactive Inhibition a Hindrance to Symptomatic Rein-

statement. "Method" performers usually maintain that no

movement language is necessary because recall of emotional

situations will, through kinesthetics, reinstate the

appropriate muscle tensions and relaxations symptomatic of

the emotions. The difficulty this study has is not so

much with the "method" view of the psychological process of

kinesthesia, however, as it is with the process of rein-

statement of a "true" feeling. The process of retroactive

inhibition, or "active forgettery," sets in quite soon

after a particularly strong emotional situation occurs,

making it sometimes difficult even for a trained psychiatrist

to help a person recall the circumstances of an emotion.

For an actor to recall these circumstances clearly enough,

to relive them sufficiently without inhibition, in order to

provide a clearly differentiated set of symptoms to match

the dramatic situation is highly unlikely. The method

performances by and large support this contention. The

specific symptoms that Stebbins, Hayes, Delsarte, Kempf,

and Campbell all describe simply do not usually occur in

the experience of this study, under auto-recall of situations.

A knowledge of what those symptoms are seems to be the best

guarantee of reinstating them in an actor and in an audience.

5-Possibility and Problem of a Specific Psychological Body

Language. The final opinions used in this section will be

those of Dr. Kempf. His are the most extreme in support of

empathic communication of specific emotions by specific
motor response. His views are somewhat old, as psychology
goes, however, and tend to recall the controversial James-
Lange theory of emotion causation. However, he maintains that
the nerve apparatus with which our body receives outer
stimuli compels the body to take appropriate postures.[35]
"An emotion only comes into existence as the peripheral
autonomic reactions become active"[36] In other words, an
emotion is not a product of thought but of a stimulated
autonomic nervous system which sets up feelings of pain,
or other, and results in an emotion. The significance of
this for empathy is that the body's reception of stimuli
always results in setting up these autonomic reactions.
Then there are always appropriate bodily reactions that
result in typical postures, or bodily attitudes, which,
together with the autonomic nervous system, enforce an
emotion upon the receiver of the stimulus. According to
Kempf, then, the apparatus is there in the human body
to enforce specific reception of emotion. The problem only
remains, according to this view, for the director to send
the appropriate movement message for the reaction desired.
A false, or unintended, message is received as sent regard-
less of intent, and hence it needs to be accurate. In 1921
Kempf called attention to the "need to cooperate between the

---

[35]Kempf, op. cit., p. 1.   [36]Ibid., p. xiii.

physiologist and psychologist in working out the relations of definite affective traits to particular postural tensions" which exist but have not yet been carefully codified.[37] The need still exists, though the groundwork has been laid, in principle by the psychologist and in practice by Delsarte.

b) Delsarte: Body Movement. A Classified Language.--In a study of natural body movement as communication one name stands out above all the rest; it is Francois Delsarte, born in France in 1871.[38]

1-Delsarte's Present Influence and Interpreters. There is much of controversy about his name and his methods, but the bulk of contemporary American dance, and both American and European pantomime, depend to some extent upon his findings and theories. Unfortunately for Delsarte and for the theatre, he wrote very little, so his "popularizers", imperfectly understanding his empirical method, over simplified, distorted, and made rigid his views until his name fell into general disrepute. The popularizers devised from his principles simple rules of elocution and exact meanings for body stance and succeeded in cutting off his promising empirical beginnings.

Few in the theatre field realize that the main positive use of his principles continues unabated, having evolved

---

[37] Ibid., p. xiv.

[38] Ted Shawn, Every Little Movement (Pittsfield, Mass: Eagle Printing and Binding Company, 1954.), p. 14.

under the cultivation of certain leading pantomimists and dancers. Most of Delsarte's credible and useful findings were handed down from teacher to pupil without ever becoming published. Unfortunately, most of Delsarte requires demonstration, not words, not alone because words are quite inadequate to describe movement, but also because of the outdated words Delsarte's followers use. Ted Shawn has tried to remedy this situation somewhat in his book Every Little Movement. Shawn's School of Dance at Jacob's Pillow in the Berkshire Mountains, preceded by his and his wife's Denis-Shawn school, acknowledges almost complete dependence upon Delsarte. Countless other professional and academic dancers, choreographers, and pantomimists have mushroomed from Shawn's Delsarte import, originally brought to America by Steele MacKaye.[39] The school numbers among its early students such artists as Ruth St. Denis herself, Martha Graham, Jerome Robbins, Doris Humphries, Charles Weidman, Louise Gifford, Jean Erdman, and Agnes DeMille.

Because of Delsarte's great influence and early empirical methods it is important to outline his views as sympathetically as possible for a modern audience, largely as seen through the eyes of Ted Shawn. Shawn not only learned directly from Delsarte's own students but compared all the extant sources of Delsarte's work before writing.

---

[39]Ibid., p. 13.

2-Delsarte's Methods and Findings. Delsarte based his ideas about the meaning of movement upon years of empirical study of human beings in a wide variety of emotional situations. His is the only such systematic attempt discovered by this study. According to all of his followers, including Ted Shawn, Delsarte went to see mine disasters, floods, and hurricanes; funerals, weddings, and demonstrations; to see individuals alone and in groups in order to take careful notes of what he observed about the movement, body postures, and voice idiosyncrasies of those actually involved in emotional situations. After making his observations he noted that behavior followed certain recognizable patterns corresponding to the stimulus and to the expressed attitudes and feelings of those observed. Being a strong trinitarian Christian, he grouped his observations easily into what was for him natural sets of threes.

The form in which his observations were made has been a stumbling block for many who could have profited from his observations. But those who have practiced his tenets have always been completely convinced of the basic validity of his empirical observations and of their effectiveness in performance. His observations must, however, in order to appeal to a contemporary stage artist, be seen as principles, as points on continua, as early formulations, and not as sterile and absolute designations.

His principal dictum became a simple one: The inner

purpose determines the outer form.[40]   Later his observations

convinced him that the process was reversible.   An accurate

creation of the outer form will tend to create the inner feel-

ing both in the mover and in the audience.[41]

3-Delsarte's Three Part Designation: Mental, Moral, Physical.

The first principle of Delsarte's is that various parts of

the body express different kinds of feelings.   The head is

the mental or intellectual area, the torso is the moral or

volitional, and the limbs are the vital or physical.[42]

These in turn each have three parts.   Within the vital

physical limbs the hands and feet are the mental, the fore-

arm and lower leg are the moral or volitional, and the

upper arm is the vital or physical.   Within the torso the

upper chest or shoulders is the mental, the chest volitional,

and the abdomen and pelvic region the vital physical.

Delsarte's subdivisions are made of the head as well, with

the forehead the mental, the eyes the volitional, and the

chin and mouth the vital physical.

Concerning Delsarte's mental type of movement, in

general if an inner impulse to act is intellectual in

nature the body movement that results seems to originate

from the head.   Usually gestures involving such interests

as curiosity stem from the head.   It is a favorite expression

of Louise Gifford, pantomime consultant for the Theatre

_____

[40]Stebbins, op. cit., p. 141.

[41]Ibid., p. 141.   [42]Ibid., p. 117.

Guild and follower of Delsarte, that the eye, the ear, or
the nose leads. If there is an intellectual curiosity one
of the senses is seeking to perceive the situation more
closely and one of the sense organs in the head seems to
lead the body to its object of interest. If the sense of
touch is involved, the hand may lead the body; the hand,
in Delsarte's terms, being the intellectual area of the
vital-physical arm.

Concerning Delsarte's moral-emotional type of movement,
if a person is motivated by moral considerations, by will,
or by objects that are noble or beautiful, the resulting
movement seems to originate from the torso, especially from
the upper portion of the torso, the chest. When a person,
for example, is moved by an impulse to approach a beautiful
sunset, there is an intake of breath, the breathing rate
increases, the chest seems to start a gesture that may lead
out along the shoulders to the hand and then the hand may
point. In this case it would be said that the chest leads.
The final part of the gesture resides in the hand, the
intellectual part of the arm, and just precedes some speech
concerning the outer stimulus, i.e., the sunset. The
intellectual aspects of the sequence come last, the hand and
speech. In Delsarte's terms, the mental (hand) is the final
concern in a sequence that originates in the plane of
nobility (the chest).

Concerning Delsarte's physical-emotional type of move-
ment, when the inner motivation is one of physical appetite

the pelvis or stomach region seems to lead the gesture.
Such a lead extends to hip movement that flows along the
upper leg, to the lower, to the foot, and ends up in a
walking movement that seems to originate in the pelvic
region. Even a hand gesture, motivated by some physical
appetite seems to originate in the pelvis.

In general Delsarte observed that movements originated
in the torso when some emotion was involved and in the head
when a mental concern was predominate.

4-Delsarte's Law of Successions: Flow and Direction. Delsarte
noted in what Shawn translates as "the law of successions"
that the sequence of movements could be either from inner
to outer or from outer to inner depending on their motivation.[43]
If a walk, generally using the vital physical legs, starts
with a foot movement, it is an intellectually concerned move-
ment. If it starts with the torso and thighs it is a strong
and primitive movement. In effect, gestures that start from
foot or hand are affected. They are the result of the mind's
deciding the body will make a gesture instead of some inner
feeling determining an outer gesture. If the gesture is
thus "affected," or originates from a desire to take or to
beckon, the hand starts the movement. The movement moves
in succession through the forearm and upper arm to the torso.
Usually when the gesture is outgoing, giving, active,
motivated from inner feeling and not by thought, the flow

---

[43]Shawn, op. cit., p. 35.

is in the reverse direction.

Generally, when one center is typical of a character, when only one kind of motivation is involved, sometimes movement seems to stay centered in the appropriate part of the body without flowing to the rest. As an example, a primitive, stupid, or highly physical man who is not particularly noble or mental usually makes his arm and leg gestures largely with the upper arm and thigh. His gesture usually originates from the plane of the appetites without flowing to the rest of the torso. The man who is primarily moved by intellectual considerations and is in control of his mind is usually rather unmoving in his torso and in his larger arm and leg muscles. His head is usually quite active, even coy, in its punctuating movements, and his hands and feet gesture usually in affected ways. If a larger gesture is needed by the "mental" man the rest of the body merely seems to follow head, hands, and feet without quite the feeling of an organic, healthy physical unity.

5-Delsarte's Nine Laws of Motion. Other observations of Delsarte resulted in what he called his nine laws of motion.[44] These are laws of altitude, force, expansion-contraction, sequence, direction, form, velocity, reaction, and extension. His view was that the laws of motion and principles of motivation held for all people. Superimposed on these

---

[44]_Ibid._, p. 50.

universals were personal styles or idiosyncrasies born of habit, cultural accretion, and personal profession or way of life. The laws, of course, were not absolute, final, or even essential, but principles arrived at empirically. Within the context of belief that every movement has form, tension, and relaxation, Delsarte felt the following principles were operative:[45]

Law of Altitude: Positive moves are always upward, outward, and forward. Negative moves are always down, inward, and backward.

Law of Force: Conscious strength assumes weak attitudes while conscious weakness assumes strong attitudes. His observation pointed to the conclusion that strong men do not have to parade their strength but often appear physically humble, while the weak usually compensate for their weakness by trying to appear strong.

Law of Expansion-Contraction: Excitement expands motion; thought contracts motion. Emotion, feeling, or overt concern results in larger, more overt, movement. Mental activity or contemplation usually results in slower, smaller, and more inward movement.

Law of Sequence: Body movement occurs in a normal sequence, what in another context may be called a normal reaction pattern. In a reaction to an inner impulse thought, emotion, feeling, or idea come first; in a reaction to an

---

[45]Ibid., p. 50.

outer stimulus sensation comes first through some organ of perception. If the inner impulse is thought or idea, next comes expression of the face; if the inner impulse is emotional, next comes a breathing change. Next, in response to the feeling or idea, comes a new attitude of the body, or body set; next comes gesture, an arm or leg movement originating from the new body set; next comes ejaculation, the emotional, or primitive, aspect of speech; and finally comes speech, the last, most civilized, and most intellectual part of any reaction pattern.

Law of Direction: Moves of feeling are toward or away from their objective. Moves of intellect are up and down in the achievement of relative heights. Moves of Volition, those of will, are from side to side. Moves of conflict are diagonal.

The last three principles of this law of direction are not so apparent as the first one. They are somewhat clarified if movement is seen not as floor pattern but as gesture.

Regarding moves of intellect, perhaps the relationship of height to intellect is one of aspiration. The reaching upward possibly symbolizes an aspiring after something mental and not an effort of will or desire.

Regarding moves of volition, legs spread to the side and arms akimbo, indicate an open aggressiveness and a strong base of support. Such a stance shows strong will.

Arms by the side and feet together rarely go with a strong will. Hence gestures to the side to Delsarte show degrees of volition.

Regarding moves of conflict, the line of a body that is leaning into an activity may show conflict with an external adversary, while lines of a body crossing each other may show internal conflict. To try to make such directional moves apply to basic floor patterns would necessitate a method of analogy; because for Delsarte they are merely classifications of observable body postures and movements.

Law of Form: The outer form of a movement corresponds in special ways to the inner impulse. If the outer response to the inner impulse is pleasant then the movement is circular, if unpleasant then angular, if mystical then spiral, if vital physical then straight, if mental then circular. There are others but these will suffice by way of example. These forms at first glance seem to reflect the meanings of abstract line. However, the reverse is more likely. If Delsarte's observations were accurate these body forms are really part of the reason why abstract line forms have their meanings. It would seem that a pleasant feeling results in less restricted, more relaxed movement, which is probably movement in circles; while the excess tension resulting from negative emotions is likely to result in jerky, angular movement. The mystical-spiral movement is beyond the capacity

of this study to conjecture, but the straight line move
certainly seems to correspond to a strong, efficient,
physical motivation and purpose. Whether these principles
of form involve cultural determinants of movement patterns
or not, or whether a predisposition about the meaning of
abstract line patterns influence Delsarte's observation or
not, is something else about which it is difficult to con-
jecture. In any case, if the moves actually occur in human
beings under circumstances such as Delsarte describes, it is
of purely academic interest to the director as to what the
source is. The language is the same regardless of its
causes.

Law of Velocity: The rhythm and tempo of a movement
is in general in proportion to the mass to be moved. This
principle seems to be consistent with the one of physics
whose effects are noted chiefly in pendulum and metronome
movement. Carrying this principle of motion into emotion,
the greater the passion the slower the movement. The
smaller the feeling, or the more surface the feeling, the
more rapid the movement.

Law of Reaction: The body reacts automatically in a
pattern of surprise and recoil. It is stated in physics
that for every action there is an equal and opposite re-
action. Delsarte noted that for most stimuli there are
emotional-physical reactions; if the reaction is self
protective there is a recoil, or immediate withdrawal,

similar to what might be called a shock pattern of reaction.

Law of Extension: A gesture can be extended in space by holding it in time. There is a more subtle principle. An example would be the throwing of a ball where the thrower leaves the arm extended then follows the ball with his eye until the ball descends. When the ball descends the thrower would adopt a new body set, thus indicating the throw was at an end and that the extended gesture was also completed.

6-Delsarte's Principles of Gesture. Most of Delsarte's observations concerning gesture stem from his bodies of law. Gesture means in this context any physical reaction from hand gestures to gestures of the entire body. A fair sampling of principles and illustrations is given below to indicate the seeming accuracy and far reaching effects of his work.

In hand gestures, the use of the thumb, observed by him in life situations, was one of the specifics that led him to his principle of expansion and contraction.[46] When the thumb is held close to, or is enclosed by, the hand, there is a negative feeling, an insecurity. When the thumb is extended there is a love, a positive feeling or an outgoing attitude.

When those same hands are gesturing Delsarte observed that they seemed to describe a cube in front of the body.[47] When extended out beyond the cube with palm toward the body,

---

[45]Ibid., p. 45.   [46]Ibid., p. 13.

a hand means to include. When held next to the body with palm out the hand means to exclude, above it means to bless, and below it means to support. The inclusive gesture is meant to summon someone; the exclusive gesture is meant to reject. Perhaps human gestures do not always follow these principles, but Delsarte provides an interesting memory system for some basic observations from which individual idiosyncrasy may depart.

Where gestures of the entire body are concerned, Delsarte provided the material from which Selden derived his idea of the giving in to, or the opposition to, gravity. Falling is a negative expression. Giving in to gravity is a giving in to opposition to the forces of life. Overcoming gravity is joy. Fear lowers, joy raises. The ultimate expression of joy is the weightless feeling of a leap.

Related to the downward or upward body moves, were Delsarte's outward and inward moves. They formed the principle of expansion-contraction. To Delsarte, outward, or opposition, movements show strife, successive movements show love, unfolding movements show growth and life, and inward, or folding, movements show decay and death.[47] These observations, as will be seen, closely parallel the observations of many psychologists as well as of later

---

[47] Ibid., p. 55.

writers on pantomime, although it may never be certain how many of the moves are analogical and how many psychological or cultural.

The front and the back of the body during movement had special meaning for Delsarte; his observation was that the back expresses universal feeling while the face expresses unique feeling.[48] The back may be bent from sorrow, over-work, or disease. The back may be straight from pride or dignity. The back may be bent in protection of the vital organs or the back may be straight in an expansive and open attitude. The back is supplemented by the lower limbs in expressing these very basic, and hence to Delsarte universal, feelings or attitudes.

The face is in the plane of the intellect. The face expresses the individual rather than the basic emotions. Possibly Delsarte places too much reliance on the meaning of facial expressions in the light of such filmic experiments as those conducted by Eisenstein to prove context gave meaning to facial expression, but this study is inclined to see some validity in Delsarte's findings.[49] To begin with, facial expression is usually the most inhibited form of outward human expression. Hence, a blank face can have varied meanings dependent upon its context. However, when the inhibitions are released, laughter, tears and various

---

[48]Ibid., p. 56.

[49]Eisenstein, op. cit., p. 13.

broad general classifications of facial expression become more discernable. To be sure, the exact label placed on these expressions is often determined by knowing the context of the expression, but the unique quality of these expressions is sufficiently differentiated for pantomimists, as will be suggested later in this chapter, to codify an entire language of what is to them recognizable facial expressions. The expressions are also differentiated enough for Tolch, in his study of facial expressions, to get a significant proportion of recognition of meanings, both in and out of various contexts.[50]

When the whole body makes a gesture it seems to Delsarte that the movement will have a special relationship to a center. The relationship will express power, wisdom, or love.[51] Power is displayed by movement <u>from</u> a center, wisdom by movement <u>toward</u> a center, and love by movement <u>around</u> a center. When an external stimulus results in an internal impulse to act, the body movement starts at a center, such as in the torso, and moves the body toward its objective. When a thought motivates a gesture, often the gesture is an enfolding and inclusive one originating in the mind and extending to the hand, and moving into an enclosing or summoning gesture. When love is the internal motivation, the center of movement is not located in the mover, is not

---

[50]Tolch, <u>op</u>. <u>cit</u>., p. 95.

[51]Shawn, <u>op</u>. <u>cit</u>., p. 60.

an appetite or a thought of the moving individual, according to Delsarte; but the center is external to the individual, that is, in the object loved. Hence the movement is one of surrounding the object of interest. Of course, Delsarte differentiates between love and desire, the latter center being located in the lower torso.

To distinguish between love and desire, and other emotions whose centers seemed to be either in or beyond the self, Delsarte evolved certain workable variables for emotion. Each emotion, to Delsarte, is composed of either attraction or repulsion, and positive or negative self interest. For examples: if one feels weak and impotent in the presence of something that repels one, the emotion may be described as fear. If one feels strong and able, in the presence of something that is attractive, the emotion can be described as aggression. To Delsarte love involves negative self feeling, or no feeling of self at all, only an attraction, or liking for, the object, plus a certain identification with the object. Desire involves a definite positive self feeling combined with attraction.

Delsarte also observed a relationship between the direction a person faces and his attitude. When a person faces an object directly he is being frank, honest, and concerned with the object. When he faces obliquely, he is being two faced. When he faces away from, at a right angle

to, the object he is honest and frank, but not interested in the object so much as in some other subject.[52] Delsarte's rationale for these observations was that a man faced in the direction of his interest regardless of the position of his listener. Of course, such facings presuppose an uninhibited speaker. When the speaker has a divided interest, divided between his speech and its listener and some other purpose, his facing is oblique, his speech is not sincere, he is apt to be conniving or hyprocritical. When he faces his listener his attention and interest are frankly focused on the same thing. Whether or not Delsarte's reasons are accurate, the feelings expressed by, and created in, an actor when he uses such facings are proof of some basis in fact for Delsarte's observations.

7-Delsarte's Principle of Breath in Body Movement. Another principle that Delsarte derived from his observations is that breath is life.[53] Breathing rhythms show emotion. If breathing is strong and rapid then an individual is very excited, if strong and slow then alive and peaceful, if weak and rapid, then weak and excited. If the breathing stops for a moment, then life is temporarily suspended. If breath is released in a sigh then life is released, the individual is relaxed and is living at a low emotional level. Laughter is the result of having so

---

[52]Ibid., p. 57.   [53]Ibid., p. 59.

much joy of living, and so much breath, that the excess is exploded in rhythmic bursts. Laughter is impossible without a great deal of breath. Crying is the result of the individual giving up. He has no breath, but the autonomic nervous system won't let him die, and the breath is forced in, in gasping inhalations, or sobs. Crying by bursting exhalations is either a fake or the result of a positive, life affirming, emotion of anger and frustration.

8-Delsarte Evaluated. This study has attempted to give Delsarte's laws of motion and body area a simple and sympathetic interpretation. They form the basis for most contemporary choreography and pantomime, and so are important both as an early attempt to systematize observation and as a key to understanding certain contemporary stage movement forms.

Delsarte's life work convinced him that movement was rooted in universal human experience and hence communicates universally. If he was correct, a director cannot arbitrarily change the meaning of a movement, because movements already carry their own emotional and universal meanings. The only place where new meanings may arise would be through unique idiosyncratic or stylistic distortions of the basic universal movement. If a director is unaware of the universals, he may convey their meaning in spite of his intent. For this reason, a dancer, pantomimist, or actor ought to start by learning the language of the human body and of the stage.

Such learning will not restrict him, but free him if he learns the language as principles, not poses, as general and empirical truths, not absolutes. The learning of any verbal language is imperative for free expressive verbal communication. Learning the language of movement should carry the same importance for movement communication.

Perhaps Delsarte's principles and specifics are not universal and convey meaning for reasons other than his. However, the actor need only try to use these principles sympathetically and in modern context to be convinced of their efficacy whenever the desire is to communicate through the duplication of nature. It is up to the psychologist to determine whether this nature is innate or learned. All the actor needs to know is that the behavior described by Delsarte is natural to the adult human being. If the human being is using learned symbols for emotions, the symbols are being used unconsciously as a part of the heritage of his culture. In any event, Delsarte will prove rewarding to the director who has the patience to wade through outworn terminology, to reconstruct, test, and improve upon Delsarte's empirical findings about the meaning of movement. Especially valuable is the experience of having Delsarte's principles demonstrated. Movement's meanings ultimately must be self evident to be true, for they are their own language and must speak for themselves.

To replace Delsarte's system really requires that

someone replace Delsarte's study using his methods without his trinitarian predispositions. Observations need to be made in America to correlate movement with emotions, attitudes, and situations in real life events. Tests in the laboratory or in the theatre will not accomplish the same task. The result of field observation will not be a list of pure psychological symptoms, but it could well be a natural, cultural language of movement.

c) <u>Pantomimists' and Dancers' Views of Mimetic Body Movement</u>.--From the views of writers on pantomime and dance emerge three tendencies in mimetic movement: the first is to accept Delsarte without much question; the second is to emphasize a more modern psychological concern with motivation rather than resultant form; and the third is to stylize mimetic movement into special theatrical symbols of realistic behavior.

1-Pantomime and Dance Dependent Upon Delsarte. There is a strong need to take up investigation where Delsarte left off. Many dance and pantomime authors state certain agreement with Delsarte's principles without presenting any specific approaches as to how to move to convey meaning. Albright, speaking directly of Delsarte says, "Certain bodily actions are so directly and universally expressive of basic emotions or attitudes of mind that it would be foolish to ignore them."[54] He goes on to state that some

---

[54]H. D. Albright, William P. Halstead, and Lee Mitchell, <u>Principles of Theatre Art</u> (Boston: Houghton Mifflin Co., 1955), p. 46.

actions are instinctive and universal and some are derived from theatre practice. However, without some systematic formulation of principles and of specific bodily actions Albright's statement is useless. The actor and the director must work not with statements but with specific movements on a stage under particular circumstances.

Other authors, when they do become specific, merely present some updated version of Delsarte, using the triune designations and often the same body-mind-soul trichotomy. Humphries states, with Delsarte, "every emotion has a concomitant bodily movement."[55] While Lutz proclaims, "Pantomime is the revelation of human emotion through bodily expression," and again, "bodily expression is less individually characteristic than verbal expression, but it is more universal and fundamental."[56] Lutz follows up her Delsarte convictions with a loosely worked out Delsarte system. However, she does not give any of the credit to Delsarte. Most of her discussion concerns establishing the need for principles in any art form, especially in pantomime.[57] Her chief principles stem from Delsarte's observation that expressive actions stem from the intellectual, emotional,

---

[55]Humphries, op. cit., p. 114.

[56]Florence Lutz, The Technique of Pantomime (Berkeley, California: Sather Gate Book Shop, 1927), p. 3.

[57]Ibid., p. 9.

and vital parts of the body which are the head, torso, and legs.[58] From that point on her system is almost exclusively Delsartian. His point of view is well presented by her, however, and by a woman who taught pantomime at the American Academy of Dramatic Art and in the California University system.

Humphries, whose fundamentals also follow Delsarte quite closely, has more original interpretations than Lutz. Her ideas are a combination of general principles of form and structure in art and of psychology with a firm basis in Delsarte.

For the above reasons, not a great deal that is new to this study appears in a survey of Pantomime principles. However, certain fundamentals do stand out, original or not, and deserve to be mentioned.

2-Pantomime and Dance Movement Dependent Upon Motivation. The pantomimists and dancers all agree that movement should be motivated, but the stress is variously placed either on the inner feeling or on the outer form. How to achieve the outer form stimulates a similar controversy in acting, the method vs. technique controversy. Should results be achieved by performing techniques or by thinking right?

The way of achieving movement that has meaning is only of passing interest to this study; however, it should be noted

---

[58]_Ibid._, p. 27.

that inner motivation without attention to outer form can
at best result only in realistic body movement. At best
the actor can only achieve the first, or unstylized mimetic,
means of communicating meaning by movement. In fact, each
of the authors studied assents to the limitation of mere
internal motivation. Either it is recommended that the
performer learns his techniques first before he performs in
a situation that must be motivated, or else it is recommended
that the result of performing from inner emotion needs to
be stylized before presented on the stage.

Perhaps the most interesting aspect of motivation from
the point of view of the theatre man is that many dancers
also insist upon it. Humphries insists on a conscious
motivation for every dance move. Her view is that in
dance, people are communicating to people about people, and
as all moves in nature are motivated so should they be in
dance. The order in which her dancers proceed in rehearsal
and in training is from emotion to mime to dance movement.[59]
Louis Horst also feels the dancer should have inner con-
viction, that it must be expressed, abstracted, and sublim-
ated into dance movement.[60] Ananda Coomeraswamy, speaking
of the highly stylized and specific Hindu dances, maintains

---

[59]Humphries, op. ct., p. 110.

[60]Louis Horst, "Louis Horst Considers the Question,"
Impulse 1954 (San Francisco: Impulse Publications, 1954),
p. 4.

that the dance-artist must be absorbed in his theme, not absorbed in resultant forms.[61] He obviously feels the dancer should know both his technique before dancing and his motivations while dancing.

Humphries declares that the alternative to motivated movement is virtuoso technique. In effect, in virtuoso technique, movement for the sake of movement replaces movement that communicates.[62] Her parting advice concerning motivation is not to intellectualize but to motivate.[63] The result she wishes to avoid is the dancer-actor who ceases to move like a human being who is motivated by a complex variety of feelings, and begins to move like a machine dominated by the one center, the brain. The result, as was mentioned in the section on Delsarte, is affectation in movement. The specific practice which she warns against is the imitation of other arts such as painting and sculpture. Such imitation will do for the dance what similar imitation would do to blocking techniques in stage plays, namely "put a blight of immobility on the dance" and provide only "static relationships."[64]

One of the few even partial opponents to Delsarte is Agna Enters. Enters says "Delsarte had tried to free French

---

[61]Ananda Coomeraswamy, "The Dance of Shiva," ibid., p. 8.

[62]Humphries, op. cit., p. 110.

[63]Ibid., p. 165.   [64]Ibid., p. 165.

theatre of its stylized form but had only achieved a formula himself. His formula, adapted to opera, theatre, and dance, succeeded in all but killing mime as a legitimate form of theatre expression".[65] It must be reiterated that Delsarte and his "popularizers" belong in separate categories. Delsarte intended no formula. However, it seems that most of what is usable and most of what is stagnating in the stage conception of the meaning of body movement stems from Delsarte. The only other significant strain originates with Stanislavsky; and even his "popularizers" have succeeded in eliminating much of his insistence on the use of bodily symptoms. They use only the inner motivation. Both Delsarte and Stanislavsky insisted on both "inner" and "outer" but the achievement of both is hard work and painstaking, so free expression rules the day and the grammar of movement continues to be in relative disuse.

3-Pantomime and Dance Movement Dependent Upon Stylizing Mimesis Into Symbol. Although Agna Enters warns against learning a specific dance form, she does recommend learning universal symbols .[66] It seems only the modern method actor has lost touch with technique. Problems arise, however, when the universal symbols are made specific. What symbols are universal and what ones are pure theatrical

---

[65]Walter Sorell (ed.), The Dance Has Many Faces (Cleveland: The World Publishing Company, 1951), p. 89.

[66]Ibid., p. 93.

convention; Humphries adds to Delsarte's specific symbols a four part designation of her own that she maintains is universal. She calls it her principle of standardized gestures ("gestures" meaning integrated movements of the entire body).

In any culture, she maintains, there are four types of gesture: social, functional, ritual, and emotional.[67] Examples of the social are the bow, the handshake, and the embrace. These are gestures with specific meanings in social contexts. They are accepted forms of social gesture. Examples of the functional gestures are those concerned with work such as burden carrying, climbing, and throwing. Examples of ritual gestures are the genuflect, the hands held in prayer, and the prostration. These gestures have accepted meanings in worship and civil ceremony. The emotional gestures, Humphries maintains, are less standardized though she subscribes in general to Delsarte's observations. Her point is that these gestures are less automatic, less under conscious control, less habitually practiced, and hence can have a greater range of individual expression within the universal basis.

Charles Aubert's specific language of pantomime also involves a mimetic basis for a symbolic language.[68] His

---

[67]Humphries, _op_. _cit_., p. 114.

[68]Charles Aubert, _The Art of Pantomime_. Trans. Edith Sears (New York: Henry Holt Company, 1927),

book is a catalogue of body and facial expression covering
every nuance of feeling and attitude. The reader's first
inclination may be to discard Aubert's system as being too
categorical and old-fashioned. Then the reader may look at
Aubert's pictures and try to decide what Aubert says is
being expressed. After a near perfect score, allowing for
differences in vocabulary, the reader may decide that
Aubert's system needs a closer look. From the closer look
will emerge two principles: the first is that Aubert's
gestures follow certain sets of matched oppositions. The
second is that the specifics of expression are exaggerated
realism amounting to accepted symbols of what expression
means. The former principle is not unlike Delsarte, while
the latter is not unlike Delsarte's so-called "popularizers."
However, both have communication possibilities, and should
not be shunned.

Some of the oppositions that emerge from a comparison of
Aubert's specifics are as follows: advance-retreat, ex-
pansive-contractive, give-take, expose-protect, and posi-
tive-negative. In effect most of the attitudes or emotions
that Aubert illustrates divide themselves into positive and
negative expression. The basis for them is not unlike
Dietrich's designations in the first part of this study, nor
unlike Selden's. The only unique contribution is the
attempt to present these principles in usable form.

Other principles that emerge from Aubert's illustra-
tions are the gestures that draw attention to, or originate

from, parts of the body. These principles are the same as
Delsarte's principles of successions. Still another Aubert
principle involves symmetry and asymmetry. His observation
here closely resembles Delsarte's oblique facing. An
asymmetrical gesture, or asymmetrical mouth, is supposed to
originate from a conniving or hypocritical attitude. A
symmetrical gesture is supposedly expressive of frank, open
honesty. Symbolically, possibly there is a certain meta-
phorical validity. If both sides of a symmetrical body
are engaged in the same activity then there is a consistency
of external, hence, by association, of internal, approach.
If one member, or side, of the symmetrical body is denying
what the other side is doing, the impression of divided
purpose, or affectation, is conveyed.

The variety of terminology used by the various authors
studied is perhaps the major obstacle to comparison and
understanding. Delsarte preferred a trinity, Aubert
preferred a duality, and mystics and modern psychologists
seem to prefer a unity of multiplicity. Whatever the
cataloguing system, or the metaphysical predisposition,
however, all seem able to add new principles and techniques
to the mimetic movement language of the stage director.

3. Metaphor Applied to the Dancer's Body Movement

The dancers yield more suggestions than the pantomimists
concerning the use of metaphor in body movement, since it
seems the pantomimists feel their movement is primarily

mimetic. The dancers view the use of metaphor variously as: an analogy through substitution of parts, a kinesthesia of analogy and abstraction, a non-verbal poetic image, and a special metaphorical relationship where the script is related to stage movement as the music is to dance movement.

a) Humphries' Substitution of Parts.--Humphries has a special analogical use for her language of gesture. Not only does her gesture provide a vocabulary of culturally standardized mimetic movement symbols, it also provides a point of departure for dance movements. Beyond the normal pantomimic exaggeration and stylistic distortion of the standardized gestures Humphries also adapts them to dance by what this study calls analogy. Her term for it is "substitution of parts."[69] One example will suffice. If a real emotion resulted in rapid, heavy breathing, a normal mimetic pantomime distortion would merely heighten or exaggerate the heaving chest and the sound of air being inhaled and exhaled. In the idea of substitution of parts first an analytical breakdown of the real life action must take place. The breathing is composed of a moving part of the body, a definite rhythm and velocity, a sound, and an empathic meaning. Humphries might decide, for dance, that the legs would take over the role of the moving part and maintain the rhythm and velocity of the breathing. If the

_____

[69]Humphries, op. cit., p. 114.

director-choreographer has succeeded in providing an
emotional context for the leg movement-breathing, the
rhythm of the legs should become attuned to the rhythm of
the audience breathing. The larger leg movement should
carry better in the theatre than merely heavy breathing.

The problem becomes one of what is communicated. Will
leg movement stimulate audience breathing rate as surely as
breathing rate would stimulate audience breathing rate, or
will leg movement be largely an intellectual symbol instead
of a motivated action? There is no easy answer. Tests
would have to be made. However, at this point, Humphries
has definitely added to the director's possibility for
communication by metaphor, and suggested a direction for
combining metaphor with imitation of the natural.

b) <u>Hayes' Kinesthesia Through Abstraction and Analogy</u>.--
Hayes calls the alternative to literal dance pantomime
"communicative symbolism," what this study means by
metaphor. Examples she presents to illustrate the principle
are abstractions of pleasure sensations such as in swinging[70]
The literal mimetic pantomime of swinging would involve
putting a swing on stage. The metaphorical use would be
to abstract the rhythm and the to and fro movement, along
with the pleasant joyous pantomimic moves, from the swinging
movement. These moves could be translated into the hand

---

[70]Hayes, <u>op</u>. <u>cit</u>., p. 91.

swinging and the body dancing forward and backward. This study maintains such adaptation is metaphorical because it illustrates the relationship A is to B as C is to D. One situation is comparable to, has analagous parts with, another. The rising and falling shape of the swing is taken over by the arms swinging. The to and fro movement is replaced by dancing to and fro. The rope is to the seat of the swing as the arm is to the hand; the body of the swinger is to the ground as the body of the dancer is to the stage floor.

Hayes suggests in her approach to abstraction that "spacial rhythms and kinesthetic effectiveness" be abstracted from literal moves and used in the dance. The stage director may have equal success in abstractions even to the point of adding new dimensions to his realistic moves. Realistic actions could also be "swinging" as well as real.

c) Erdman's Non-Verbal Poetic Image.--Jean Erdman thinks of dance not as pantomime, but as "non-verbal poetic image".[71] Hers is a form of metaphorical meaning where dancers become the embodiment of interplaying forces. In depicting these forces it would seem that she would need other metaphors, such as waves or winds of force, to help her picture her movement. So in effect she uses a double metaphor.

---

[71]Sorell, op. cit., p. 197.

d) Music and Dance Analogous to Script and Stage Movement.--Because dance is almost always performed to the accompaniment of music, choreographers have depended upon music a great deal for the form of the dance, as stage directors have depended upon the script for the form of the stage movement. In fact, it seems possible for the stage director to consider the relationship between music and the dance as analogous to that of the script and the stage movement. The emotional values in the rhythm, tempo, and structure of music can be analogically related to the script, while the dance is related to the stage movement.

To illustrate the use of the analogy, Hayes warns that a dance should not "ride the music"; for example, if there is a rising and falling of the scale the dance should not synchronize with it in a rising and falling movement.[72] The result would be comic, melodramatic, or certainly redundant at best. Her suggestion is to provide contrapuntal or contrasting movement, to dance to the underlying theme of rhythm of the music instead of to match the music line by line. The same principle is of value to the stage director who relates movement to words. Contrapuntal rhythms and meanings between the movement and the words provide more depth and interest. They also tend to provide in the play what the bass is to the music, i.e., a solid

---

[72]Hayes, op. cit., p. 96.

foundation to the structure, an emotional plot line, or a theme line, that consistently portrays the spine of the play. In any event, pantomime that has strictly verbal meaning should be avoided in accompaniment to words, even more than in accompaniment to music. Two forms expressing the same thing provide an echo that can be very confusing.

Humphries suggests that the relationship of dance to music should be like a dialogue; here she is using the stage situation as an analogue for the dance.[73] Music, to her, editorializes on, does not dominate or duplicate, the movement. The actor should be dominant. Probably here the analogy between play and dance breaks down, but it is at precisely these "break" points where some of the best ideas occur. The analogy breaks down because music, unlike speech, is only the accompaniment for the dancer. The dancer, it is understood, is to be dominant. However, music and speech do not have a parallel function. Speech originates in the actor, and so either speech or movement would still keep the actor dominant. However, if one carries the analogy further, the idea arises of considering the speech and the movement of actors as having a dialogue relationship to each other with the movement aspect of the actor the dominant one. An example of this dominance might be a situation devised to make the underlying intent of the scene more important than the words. Perhaps a casual

---

[73]Humphries, op. cit., p. 80.

conversation is being held on stage as a cover for some momentous action afoot.

A daring application of this analogy could be made, however, in scripts whose verbal repartee is not all that it should be. Every director sooner or later must face the script that is light and fluffy, that has little literary merit and rather hackneyed situations. A creative director, by using contrapuntal and dominating movement, can do wonders in depth with such a script.

A peculiar result of working with movement alone is that the artist becomes aware quickly of just what cannot be expressed by movement, what situations require words. Humphries notes that philosophy, statistics, mechanical and literary themes, and vast scale universals cannot be expressed in movement.[74] Movement primarily needs human action, not human ideas, to perform. Hayes adds that words are needed for anything specific and factual; also that words are much more efficient than stage movement in bringing two ideas together in quick succession.[75] Of course the filmic montage accomplishes this joining feat with some ease, but her point is still well taken for the stage.

[74]Ibid., p. 36.

[75]Hayes, op. cit., p. 125.

4. <u>Symbol in Dancer's Body Movement: Meaning Derived From
Dance "Sign Language"</u>.

What the inexact communication by body movement
logically leads to is the prospect of a standardized sign
language of movement meanings. Dancers and pantomimists
alike realize there is no such language of movement in our
Western Hemisphere. The closest the director can come to
it is with the four types of standardized gesture of which
Humphries writes. Even so, those gestures do not substitute
for words; even though their meaning is specific, it is
mostly non-verbal.

For a verbal language of movement the director must
turn to the east. It takes a long established culture, or
one that is inbred and relatively immobile, to develop a
dance or pantomime form that has as many specific meanings
as a verbal language, especially one that is as generally
understood as a national verbal language. Hand movements
of the Hindu, Ceylonese, Burmese, Chinese, Japanese, and
Balinese dancers have approximately achieved such uniformity
of meaning. Even the Hawaiian hula has to some extent
standardized its hand gestures, though its vocabulary is as
small as its verbal language.

Is there any way that the stage director may employ
this third method of communicating by movement, this
movement sign language of certain dances? To do so would
seem at this point as monumental a task as perfecting a

movement Esperanto. The first task would be to devise the
language from symbolic and symptomatic movements already
in the vocabulary of the culture, from pantomime that would
have the most universal associations, and from metaphors
that would be best understood. The next task would be to
establish and standardize such a language through usage.
Even to approximate such a goal would take many lifetimes
and even then would probably not be successful. It is true
that fast moving cultures like to watch movement that they
understand, that is relaxing, diverting, and cathartic.
However, they do not seem to like to add more work to busy
schedules. A language of movement that duplicates, without
improving upon, the verbal language already in use, would
be one tool too many. It seems that busy America would not
be dilletante enough to cultivate such a literal language of
movement, even if it were desirable to do so.

__. Communication by Body Movement Starts From Reality

Something that Picasso said will serve to end this
section on communication by body movement. In speaking of
the source of his art he said, "There is no other point of
departure than reality".[76] To retain meaning in a movement,
that movement's relationship to reality should be apparent.
It can be apparent regardless of whether the stage director's
language of expressive movement relates to reality by

---

[76]Sorell, _op. cit._, p. 245.

abstraction, mimesis, symbol, or metaphor. If he evolves
his language with as much imagination as Picasso evolves
his paintings, the director should have no trouble in both
reaching and startling his age and culture.

D. Conclusion: Fine and Gross Movement Without Words, Vehicles for Expression or Communication

Not all dancers feel their role as artists should in-
volve communication. Some desire to express themselves
either for the joy of expression or for presentation of
formal beauty. Communication of specific plots, ideas, or
feelings is not in their province. Their thought is that
the dance can and should only express itself.

1. Communication Problem: The Untranslatableness of Art

A proponent of the "dance for dance's sake" point
of view could well draw upon a concept from aesthetics,
the untranslatableness of art: No art object can be
successfully translated into another medium, or even into
the same medium, without some loss or change. A painting
can be described by literature, but the two media are not
equivalent. A dance can portray a story, but the two are
not the same. A movement can be described in words, or
felt as emotion, but the words or the emotion are not the
movement. The movement is itself, says itself, and can
only be adequately translated by repeating the movement
itself.

This point of view about the untranslatableness of art
is valid enough. No two things are equal, and certainly
when a change of medium occurs there is very little equiva-
lence remaining. However, approximate translations can be
made; given the loss or the change as a necessary part of
the process, translation not only can but does occur. For
example, as has been previously discussed, empathy accounts
for a translation of actor body movement, through audience
associations, into audience feelings regardless of the
communication intent of the dancer or actor. Some communi-
cation takes place through empathy with even the most
abstract or formal movement.

2. Audience Reaction to Communication: Diverse or Controlled

Although some communication will take place with any
movement, the more abstract, the more esoteric, and the less
contextual that movement is the more diffuse will be the
reactions of the audience. Each member will respond
according to his own experience; the very esoteric nature
of the dance of "pure expression" will allow for diverse,
chance, uncontrolled audience reactions. However, the
more generally recognized the dance movements are the more
they allow for, or even enforce, uniformity of audience
response.

It seems to this study that a dancer or director would
want to control whatever there is in his art he can control.
He would not want to leave anything to chance where he could

exercise control. If so, then it behooves the abstract
artist to know what connotations his abstractions have,
and to control the affect they have on his audiences. In
any case, if a performer successfully expresses an emotion
(unless it be by some intellectualized concept of a symbol
that somehow has connotations for himself alone) he will
successfully communicate that emotion as well. In fact, if
he truly expresses the emotion, the expression must first
reinstate the emotion to some extent in himself, by the
process of kinesthetics. If the symbolic or symptomatic
expression does not reinstate the emotion in himself at
all, he is probably not expressing it. If the performer
has been an active member of the human race, and is per-
forming in his own cultural environment, then the symbolic
expression should be at least similar to that of his
audience, and should be communicated to them. The accurate
symptomatic expression should communicate itself to any
audience anywhere.

Of course, if the findings of this study have any
validity, even the abstract formal elements of dance will
communicate feelings to, and provide associations for, an
audience. It seems, then, that a strictly expressive, or
formal abstract, pantomimic or dance art does not exist in
any pure state. Hence either the artist controls his
medium and designs his communication or he allows certain
aspects of his art to be out of his control by letting each

person or cultural group derive the meanings that are forced upon it by its particular background experience.

3. Content of Movement Communication: Musical and Emotional vs. Ideational

Some dancers maintain that movement can have a pure empathic communication function without plot content. A sequence of movements may provide build and climax, variation and contrast in emotional meanings, much as in music, without a specific story line. A movement theme may be an emotional rather than an ideational one. For examples; the structure may be according to musical or emotional rather than narrational forms.

a) Movement Content Structured According to Music.--A typical dance and music form is the ABA, where a first section of music is repeated, with variations, in a last section. The movement pattern is also repeated with variations. The familiar section with a new twist provides satisfaction for an audience; the dances comes full circle, and the end is tied in with the beginning. It is tied in largely by way of formal and emotional movement elements, not by narrational content.

There is a suggestion here for the theatre director. It is to structure his movement patterns in some way which will formally and emotionally relate to each other by tying the beginning to the end, or by alternating patterns throughout his play in some symphonic way.

b) <u>Movement Content Structured According to Emotion.</u>--
A second suggestion from dance to the stage director is to
provide his play with some pure emotion. This can perhaps
help him in two vital ways: one is to unite his audience
with his play, and the other is to give his audience a
cathartic release of tension. No matter what the idea
content of a play, no matter how universal and appealing,
the ideas are apt to be controversial to some extent and
involve the audience in thinking. Thinking can both divide
an audience and tire them. This is not to suggest that
thinking is bad, but a director desires to consolidate
his audience, not divide them, even in thought. So, a
purely emotional scene, carried largely by emotional
movement, such as a dance insert, can help for that moment
to unite an audience emotionally instead of to divide them
rationally. Once they are united, they enjoy the play more,
and it may be easier for the director to direct their think-
ing and feeling with his techniques of communication.

The second aspect to the emotional scene, the cathartic
release, is implied in the first aspect. The cathartic
release, the abandonment to emotion, really precedes the
unification and provides a healthful empathic exercise and
release of tension. The director has to remember that a
play may be work for him, but it is play for his audience.

In essence, the dancer suggests to the stage director
the playing of the pure empathic scene. In it, symptoms

and symbols, symbols that are so well learned that they are
thought of as symptoms, communicate the emotional nature of
man directly to the audience in a way that can unite the
audience in feeling with the play.

4. The Dance Trend: Communication Over Expression

Usually the contemporary dance choreographer, who
deals with silent movement, is compelled to be concerned
with what is communicated by the expressive qualities of
movement. His is the struggle to avoid becoming esoteric,
i.e., moving for the sake of movement, and to avoid merely
perpetuating certain virtuoso dance steps. Ballet, tap,
and acrobatic dances have tended toward this lack of
communication. But when a choreographer is not only an
artist but has a social consciousness and something to
say, communication by movement is essential to him, and
the stage director can learn much from such a choreographer
to enrich the play's language of movement.

The conviction of modern dancers, pantomimists, and
many psychologists is that every body movement means some-
thing. As Louis Horst puts it, one "can't invent a move-
ment. All have some original emotional meaning and
arouse kinesthetically some correlative of the original
experience."[77] When a universal symptom or symbol is

---

[77]Horst, op. cit., p. 5.

discovered it will convey a universal meaning, a meaning much enriched by each individual's experience.

Movement has great untapped potential. A study of Hutchinson's book on Labanotation convinces the reader of the vast number and subtlety of possible movements.[78] This system for recording movement also convinces the reader of how few of these movements are actually consciously employed on stage. Delsarte's pioneer investigations and the views of certain present day psychologists show the vast potential for meaning that the large number of movement variations have. Together, these studies reveal how much investigation still has to be made into natural symptomatic and symbolic movement, into the application of metaphor to movement, and into the possibilities of a standardized language of movement. In the meantime, these studies also reveal a great deal that the practicing stage director already can add to his craft from the principles and techniques of the pantomimists and the dancers.

---

[78] Ann Hutchinson, Labanotation (New York: James Laughlin, 1954),

PART III

CONCLUSIONS: TOWARD A LANGUAGE OF MOVEMENT

CHAPTER VIII

A FOCUS ON MORE DYNAMIC MOVEMENT MEANINGS:

COMPOSITION, PICTURIZATION, MIMESIS,

METAPHOR, AND SYMBOL

Movement variables have been grouped in this study into
two major categories: movement for emphasis, or focus, and
movement for meaning. Alexander Dean, as has been seen,
makes similar distinctions which he calls composition and
picturization. The first category, composition, draws
attention to the structural aspect of movement; the role
structure plays in bringing audience attention to bear on
the meanings of the whole play, be those meanings conveyed
by movement, picture, or words. The second category,
picturization, draws attention to the meaning of that same
movement, the role the movement plays in supplying meaning
to a play. Composition principles should enable the director
not only to point to a single element in focus, but to
create an entire range of values in both time and space,
and also to determine degrees of importance in either
simultaneously or sequentially presented material. Once
composition has determined to a large extent what will hold
the attention of the audience, picturization, or the meaning
of moving and pictorial relationships, should supply the
moving content to which the audience attends. These meanings
of movement seem to be of three varieties: mimetic,

metaphoric, and symbolic.

In this chapter some suggestions will be made to the director to help him organize and supplement his principles and techniques of composition and movement meaning.

A. More Dynamic Composition: Through Balance and Flow

One of the challenges of this study is to find more dynamic movement compositions that will take advantage of the strong impression movement makes upon an audience.

The crux of dynamic movement seems to be in keeping the element of balance from becoming static, and in keeping still pictures from interrupting the flow of continuity. By combining principles from various media, for the most part already discussed in this study, certain dynamic balance and flow compositional relationships emerge. They are presented here for the scruntiny of the director. He may pick what he likes and discard the rest; he may recombine to suit his own taste or production. However, the method of abstraction, combination, and reapplication may prove helpful whether or not individual suggestions have for him direct use.

1. Dynamic Use of Balance in Moving Composition

Balance in moving composition provides the director with additional possibilities for a combination of principles. Most lists of aesthetic elements include balance as a must in composition. However, the dynamic use of balance is rarely discussed, beyond the suggestion that balance should

be thought of on the stage as an equilibrium in time, not just in space; balance may not ultimately be achieved until the final curtain.

a) <u>Balance in Time as Well as Space</u>.--The general concept of balance in time and space suggests a useful ratio. In static physical balance, as has been seen, a mathematical computation is made to assure balance: the distance from the fulcrum times the weight of the opposite object. In moving balance somehow time needs to be considered in the computation. Given the product of the mass and distance from the fulcrum of one compositional element, one can multiply that figure with the length of time the weight is held at that distance. If the total product of mass, distance, and time on one side equals the same product on the other side of the fulcrum, the total play movement is balanced.

1-Actual vs. Apparent Balance in Space. Of course it is to be remembered that impression of weight and distance are more important on stage than actual weight and distance. It is also to be remembered that the fulcrum is not only a center point in the plane of the stage floor, it is also a center point in the plane of the proscenium. In effect, to some extent the fulcrum has to be thought of as being at the center of a rectangular cubic space that lies within the six bounding planes of the stage space. To complicate the computation still further, it has to be remembered that up and down stage space does not seem as deep as it really is,

that raised and lowered movements tend to find their center closer to the stage because of the given "weight" of the stage floor, and that the eye tends to find the center of a composition slightly left of the mathematical center.

The above considerations suggest that it would take all that physics and art can do, together with the help of an electronic computer to establish when a play actually finishes in balance. Such a computation is, of course, not advised. However, the principles and variables that go into such a computation can be very valuable in estimating the balance of a scene, of an act, and of a total play. 2-Apparent Balance in Time. Fortunately for the director, another factor makes an actual balance, such as described above, unnecessary even in theory. The audience tends to place most emphasis on that which is most recently seen. Minutes of imbalance may be compensated for by seconds of balance; minutes of stage left can be compensated for by seconds of stage right. So, using the principle that the last seen creates the strongest impression, the director can achieve apparent balance in time with relatively uneven totals in a computation of actual balance or even of apparent balance in space alone.

To illustrate, in a dynamic balance in time, rather than simultaneous in space, there is a balance relationship that may exist between two unequal scenes. The movement and its speed may give scenes of different lengths equal weight. A short scene of more rapid, intense, or massive movement will

balance with a longer scene of less rapid, intense, or massive movement. For example, in a sequence of scenes that are building to a climax, each scene may be shorter than its predecessor. The last and shortest scene, however, is expected to carry the greatest impact, that is the greatest impression of weight. To give this sequence its proper build each scene can have more people in it, more movement, more rapid movement, more volume, and more intense or violent movement than the preceding scene. An approximate ratio then is seen to exist. The shorter the scene, the more mass and movement is needed to maintain apparent weight.

b) <u>Effect on Audience of Apparent Balance and Imbalance</u>. --Given the above variables and principles with which to work there are certain interesting ways in which apparent balance factors affect audiences. There appear to be certain static, potential, and kinetic qualities to apparent balance and imbalance. The relatively static effect of apparent balance seems to imply rest, poise, equilibrium, and stability. Imbalance with no potential for change seems to imply apprehension or irritation. Apparent imbalance with potential for change implies motion; while imbalance in motion, or kinetic imbalance, seems to imply a seeking of balance. These implications result from the audience's expecting from apparent and pictorial conditions the same thing that they have learned to expect from actual physical conditions. The relationship between real and apparent

balance is then analogical.

1-Static Nature of Apparent Balance. There are two basic
kinds of apparent balance. The symmetrical kind tends to
be dull and static while the asymmetrical kind tends to be
more interesting, but still static. Apparent balance
appears dull usually because it contains no potential for
movement. Even as no physical movement is possible when
actual physical balance is achieved, so no physical or
mental movement seems appropriate out of apparently balanced
stage pictures; only an eccentric moves. When an unbalanced
composition has either potential for movement or is kineti-
cally in the process of achieving balance, it is the most
exciting composition. It would seem, then, that even a
relatively balanced composition needs some slight imbalance,
a potential for movement, to keep it from becoming static.

Hence, a total balance is best saved for the conclusion
of a play. In fact, if the director desires any sort of
continuing thought or feeling after his play perhaps the final
curtain should also contain some elements of emotional,
ideational, apparent, or actual compositional imbalance.

2-Potential Nature of Apparent Imbalance. There may be in
an unbalanced combination of masses the potential to seek
balance. Each imbalance becomes a tipping, a falling, or a
similar upsetting of the entire pattern. If on stage such
upsetting does not actually take place, because there is no
force combined with the unbalanced masses, the static im-
balance becomes not exciting but irritating. The imbalance

that is potential, that contains within it the force
necessary to achieve a balance, is exciting. The balance
achieved may again be static, pleasant at first but eventu-
ally irritating; there is no place to go from the apparent
balance achieved unless it, too, has in it some imbalance
to give it potential for movement.

3-Imbalance Seen as Dynamic Balance. When both force and
mass are involved to create an unbalanced stage it seems
that the result can be an apparent imbalance that is really
a dynamic balance of either the potential or the kinetic
stage. The principles are these: an unbalanced stage
picture, with force ready to work on the unbalanced masses,
makes a potential stage while an imbalance in the process
of becoming balanced makes a kinetic stage. An unbalanced
stage becoming more unbalanced is a stage in tension; the
string of the bow is being drawn back and the stage is
becoming more potential through motion.

Strictly speaking, both the kinetic and potential
apparent imbalances seem to be in apparent dynamic balance,
if there is some power, or force, either motivational,
ideational, or physical, that maintains a taut imbalance of
masses. A restraint within a character, an outer force
winning a battle, or the force of an argument driving a
character to a wall all tend to throw the mass of a stage
picture off balance, but the mass is balanced by the force.
In effect, then, there need not be any real imbalance on

the kinetic or potential stage, when balance is properly understood. There is only an imbalance of forces or an imbalance of masses. One side has the force and another the mass. In effect, then, the only static balance exists when each side has an equal mass and an equal force.

In action, when the force of one side overcomes the mass on another, there exists a sort of special vacuum in the composition. To maintain balance, the victorious force, which also has some mass, expands its mass to fill the vacuum. The winning force becomes less compact and "takes stage." If the victorious mass fills the stage in an apparent balance, then the conflict is over and probably also the play.

4-Problem of Static Balance and Kinetic Imbalance. Perhaps the only way to rescue a play from the static balanced stage or from the perpetual motion of a kinetically unbalanced stage is by a compositional form of the deus ex machina. If static balance does not have a seed of imbalance and kinetic imbalance a seed of balance it would appear that an external element needs to intrude to make a change. When perpetual off-balance cannot be modified to create a rest, a pause, or a conclusion then an outside force, or mass, be it physical or ideational, must be brought in to create a balance. When forces are in a deadlock of balance only an outside force can rescue the situation from its static condition.

The director and playwright together need to tread a fine line between balance and imbalance. There should be

enough inequality of mass and force to provide motivation
enough to impel the movement, and enough equality of mass
and force to bring the moving situation to momentary rests.
To be able to provide these conditions within the situation
itself, without the necessity of bringing in outside forces,
masses, or ideas, is a skill as important to the planning of
the movement as to the planning of the script.

c) Application of Principles of Apparent Balance in
Time. There seem to be special ways in which mental and
physical movement, seen as movement of force and mass, may
help to create an apparent dynamic balance. There also
seem to be apparent balancing weights to tempo and rhythm
as well as to the emotional tones of stability and instabil-
ity. Each can add to the dynamic balance.
1-Apparent Weight of Mental and Physical Movement. Some-
times the director is faced with building a sequence of
scenes where there are fewer people in each succeeding scene.
The climax may arrive with only a dialogue. To offset the
shorter time and the decreased mass, there needs to be more
and faster movement and possibly a greater amount of mental
movement to offset the lack of physical movement. If physical
movement is difficult to motivate, weight may have to be
achieved with a taut climax using the tug-of-war rope as an
analogy. Contending forces bring the conclusion to a
balanced tension that is powerfully potential, that shows the
result of physical and mental movement, and that carries as

much weight, for that instant, as all of the forces and masses that the tension implies.

2-Apparent Weight of Tempo and Rhythm. Movement may achieve force for the potential or kinetic stage also through pace and rhythm. The slow move is more potential, the fast move more kinetic. The steady, slow move has more force than the erratic or staccato move because of two things: The slow steady moving object will keep the audience's eye focus more easily and will connote a large, powerful mass.

3-Apparent Weight of Emotional Tone: Stability and Instability. There is a special way in which the relative balance of line, mass, and form may effect the emotions of the audience, through empathy, to create apparent weight. If an object on stage, moving or still, is felt to be bottom heavy, there is an impression of security and stability. Possibly the reason is that the audience empathizes with the object as if it were a standing or sitting man. A man with a broad base of support has a secure balance, and so the audience feels secure with an object having a broad base. On the other hand, when an object appears top heavy or leaning, the audience gets the feeling of instability or insecurity. Again the motor reactions of the audience are similar to those it would have in witnessing a toppling human being.

The object which is stable or unstable may also be sympathetic or unsympathetic; it can also appear stronger
or weaker than the audience. These variables will give the
compositional element additional emotional connotations.
As an example, if the toppling object is strong and un-
sympathetic the audience feeling is apt to be fear; if the
strong object is sympathetic and secure the feeling is apt
to be one of joy; on the other hand, if a weak object is
unsympathetic and insecure, there is apt to be a feeling of
ridicule or comedy.

In essence, the stable base is static while the unstable
base is potential. Strength and lack of sympathy attached
to potential becomes ominous. The extreme opposite, a
horizontal object in complete balance as a lying man, with
no potential for movement, provides complacency. The in-
stability or stability of the position of a stage actor or
a piece of scenery seems to get its connotations from audience
empathy and motor response. The entire stage seems to make
an audience react by a similar process. It remains for the
director to take advantage of the excitement and potential
that relative imbalance can create in order to produce a
more dynamic stage movement.

2-Dynamic Use of Flow in Moving Composition.

Ideas about flow derive principally from a metaphor from
nature, that is the constant movement of life, and a com-
positional element of "one thing at a time" applied to the
two basic flowing movements: physical and psychological.

a) <u>Continuous Flow in Physical and Psychological Nature</u>
<u>Applied to the Stage</u>.--Movement flow in life is constant; in
nature when movement stops life stops. In a play when move-
ment stops, the life of the play also ceases. However, a
constant flow of movement, with a constant tempo, rhythm,
intensity, direction and magnitude, is both tedious and un-
like life. There are numerous fluctuations for a multitude
of reasons. To further complicate the idea of constant flow
there seem to be two kinds of movement occurring simultaneous-
ly in human beings, psychological and physical. A play also
has two flows of movement--that which is idea, carried
largely by words, and that which is action or emotion, carried
largely by body movement. To complicate constant flow still
further, there is also a narrative, or plot, flow. However
this script movement of plot does not result in a third type
of stage movement since it is carried by both psychological
and physical movement, by both sight and sound.

b) <u>One Thing At A Time Applied to Flow</u>.--The director
can devise some interesting compositional relationships,
between the amount of flow of these basic two varieties of
movement, by the principle of one thing at a time. A danger
in the principle that many directors find difficult to avoid
is a predilection toward only movement or only words. The
result is that somehow the movement of the script is almost
always carried by the words, or else always carried by
physical movement. Another danger is that "one thing at a

time" becomes such a ruling principle that movement occurs largely in a sound or verbal vacuum, while words occur largely in a body movement vacuum. Its opposite danger is that the meaning is contained simultaneously in both physical and mental movement and hence results in redundancy. One thing at a time, applied, really results in degrees of dominance of mental and physical movement rather than an absence of either.

c) Flow Relationships Between Mental and Physical Movement.--Several relationships between the psychological and physical flow, using modifications of the principle of one thing at a time, may be useful to the director. A basic principle is this: When the movement of the script is largely mental, verbal, or conceptual, i.e., a movement of idea, physical movement should be retarded proportionately. When the movement of the script is largely physical, emotional, or active, i.e., a movement of body action, of doing, then mental movement, or words, should be retarded proportionately. Words and moves each have meaning separately; each by itself is capable of carrying almost the entire content of a scene. Radio directors and pantomimists can attest to the abilities of each to provide all that is needed to communicate. When both are together each must be modified to contribute to a total that is the sum of, or more than the sum of, its parts. Otherwise there are
two wholes simultaneously presented and focus is confused,
like in a two ring circus. There should be only one whole.

The above principle can be applied in many ways depend-
ing upon the play in question and the director's interpre-
tation of it. Several ratios will be suggested.

1-Ratio Between Physical and Mental Movement. Whenever the
director reduces physical movement he must augment mental
movement such that the two combined will always total a
single whole. The magnitude, tempo, and complexity of
physical movements are all attributes that can be varied in
inverse proportion to the amount of mental movement. The
number of words, the complexity of ideas expressed, and the
tempo of expression are attributes of mental movement varied
in inverse proportion to the physical movement. If mental-
oral expressions are largely sounds, repeated words, and
ejaculations then physical movement can be at its strongest,
for physical movement will carry the focus and the meaning
of the scene. When the sounds are words conveying a complex
plot point, or theme of the play, there can be significantly
less physical movement, for the words are carrying the move-
ment and the meaning of the play.

The first suggestion for relationship between the two
kinds of movement is, then, for the director to consider
wave-like fluctuations in each medium, i.e., sight and
sound, such that both are flowing constantly and simul-
taneously in an ebb and flow, with one medium dominant, or

flowing, while the other is recessive, or ebbing. Thus the fluctuations will match the degree of mental and physical activity going on in the script at any particular moment without any one activity ever ceasing completely.

2-Ratio of Mental Action to Mental Movement, Physical Action to Physical Movement. The second application of the relationship between mental and physical movement concerns the type of movement presented to accompany the physical or mental script action. Using Delsarte's principle that parts of the body correspond to kinds of motivation this study postulates that mental script movement can be accompanied by physical movement of the body extremities, the "mental" parts of the body, while appetite-satisfying or emotional script movement can be accompanied by physical movement of the larger muscles and can originate in torso centers of the body. Small movement accompanying thought is not only small in size but it is more delicate and minute. It is also carried by the smaller parts of the body that can make more intricate and rapid adjustments. Larger actions of the physical play are carried by larger muscles as well as by larger movements.

The accompanying of the type of script action with the appropriate type of body movement suggests a further relationship that may help in creating potential for succeeding scenes. Large movement accompanies physical action that has resulted from thought. Small movement accompanies thought (mental activity) that will result in physical action. This

interrelated statement of the principle is pregnant in that
it suggests a continuity, a dynamic. In each move or small
sequence there lies the seed, the potential, for the next
sequence. Also in each scene where one medium (sight or
sound) is predominate there lies the seed of a reversal to
make the next medium predominate. In this way physically
more static sequences are interpreted as preludes to action,
never merely as thought for the sake of thought.

3-Ratio of Gross to Fine Movement: Blocking to Business.
Another relationship between physical and mental movement
can be thought of as the relationship between the two basic
kinds of movement: Gross blocking movement and business.
Each kind of movement can be considered a continuum that
relates in inverse proportion to the other continuum. One
continuum would be the range from detailed, complex, important
business to no business at all. The other continuum would
be the range from no large body movement to large group and
large space covering moves. In general, when the movement
is gross the business should be retarded proportionately.
When the business is complex, the gross movement should be
retarded proportionately. In a sense, the ratio is like that
between the verbal and the physical. When mental movement
with business is predominate then physical movement should be
recessive. Again, the suggestion here is to maintain a flow
so that both kinds of movement continue simultaneously, but
in a relationship that does not have more going on at a

time than the audience can comfortably take in.

4-Ratio of Physical to Mental Movement in Equilibrium. When the various ratios are applied there appears to be a large middle ground where both elements are in approximately equal focus. The result is a period wherein nothing is really in focus or emphasized. The simple solution is always to have some element dominant even though there is relatively equal portions of both. However, there seems to be one way in which this unfocused relationship can be turned into an asset. When the flows are approximately equal, the director has succeeded in doing in one way what the film director does in a reestablishing shot. After a closeup, tension and attention need to be relaxed. To loosen the shot the director returns to a longer view and lets his audience eye move around a more complex, less tightly focused picture where no one element is so vital as is the total composition. To accomplish the same purpose the stage director can use his simultaneous flows of both mental and physical movement. Neither is large enough, nor important enough, to merit total attention, and so the total physical-mental movement composition carries a more relaxed or diffused focus. Then, when one element does need to come into stronger focus, a gradual or rapid decrease of one kind of movement coupled with an increase of the other can help to direct the attention.

d) Problem in Flow Relationships: Lack of Punctuation and Phrasing.--An important problem with the flow concept

can be that there is not sufficient punctuation and phrasing
to establish rhythms, to convey units of meaning, or to
allow for staccato sequences. The solution seems to be
that the director ought to vary his ebb and flow to create
phrasing units and to consider inserting the various kinds
of blocks that might normally impede flow. Hesitation, gaps
in either speech or physical movement, "corners" of physical
movement where directional changes take place, and punctuation
in speech, all help to provide internal structure to the
overall interrelationships of waves of movement.

1-Punctuation Derived from Speech. The relationship between
flow and pause may well be similar to a relationship in
speech. The important part of speech is the flow of subject
and predicate, coupled with its modifiers and connecting
words. The punctuation takes the least space and the least
time. So it is with stage movement. The flow of mental
and physical action is predominate. The stop or hesitation
of punctuation should be for the shortest time possible in
order to keep the action of the script alive. The duration
and variety of hesitation may find interesting analogs in
the variety of speech punctuation.

2-Punctuation Derived from Nature. The director can make
very effective use of "stop action" punctuation if he uses
it sparingly and according to living, moving principles
instead of according to static art principles. In general,
a stop of a flow is the stopping of life. However, in nature,

especially in human beings, there are normal hesitations
that can provide clues. It would seem that the director
cannot stop all action on stage, both mental and physical,
for longer than a man can hold his breath if the life of
the play is not to be killed as would be the life of the
man. The point is, that the play can be considered as a
living organism whose life can flow in fluctuations, now
accenting this aspect, now that, but the organism cannot
cease movement entirely for long without becoming sick or
dying. The director can certainly experiment with the
play whose structure is like that of a man confined to bed,
or of a psychotic whose body and mind remain in a corner of
the room; however, a healthy audience is more apt to be
empathically pleased by a full blown, healthy, living play.
3-Punctuation to Accent Past. A structural advantage to the
momentary departure from life's ebb and flow is that the
unusual draws attention to itself. A gap in the flow
suddenly draws a strong focus, usually to the words or the
action that immediately preceded the gap. Usually the
physical activity, or pose, that remains during a silence
in some way symbolizes, or pictures, what was meant by the
action or words that preceded the silence. Hence a
hesitation allows the audience to contemplate for an instant
the relationships that have resulted from the movement.
This relationship fixes itself in the audience's mind as a
point, or a fact, or an idea that is now available to be

added to the next point and eventually to form a total complex of meaning.

4-Punctuation to Accent Future. The stop action device can also draw attention to what follows the gap. It is difficult to describe the difference between a gap that accents what precedes and a gap that accents what follows. In fact, it seems that all pauses must first emphasize what preceded them for what follows has not yet occurred. The point to be made is that the nature of what precedes the pause determines whether the audience looks back or looks ahead. If the actor says, "Wait a minute," and then pauses, the emphasis is first upon the words "wait a minute," and then those words point ahead to beyond the pause, setting up anticipation for what is to follow. A suspension is created by the words. On the other hand, a hesitation can follow "You see what I mean?" In which case the audiences' attention roams back over the preceding sequence and, in effect, it reminisces instead of looks forward.

5-Punctuation to Provide Rest. The gap may provide a re-vitalizing function as well as an emphatic one. In life, man or nature needs periodic rest in order to move ahead with renewed energy. During rest some residual activity is always present; never does all movement cease. However, if a climax of physical movement is needed, it is well for the director to find a place to physically rest his actors, and empathically rest his audience, before plunging into

the physical climax. Such an idea as the calm before the storm might prove helpful. If physical movement has been building toward a physical climax, mental activity, or at least its verbal expression, has been waning. Then, before the actual physical climax takes place, physical rest takes over for a short time and finally a burst of physical activity takes place. Following the flow ratios suggested, during the pause in physical movement mental movement takes over, final plans are laid, and thematic thinking takes place to justify the coming physical action. Audience suspense is maintained even as suspension of physical action is maintained, as long as the thought is handled as the pre-lude to action, that is, as long as the scene is potential. After the rest from one kind of flow, the audience is re-vitalized and eager to plunge into the climax sequence. The same relationship would also hold true for verbal or mental rests. After much physical activity on stage the mind has been resting and the audience is ready for clever witticisms, complex themes, or involved exposition.

6-Punctuation to Provide Tension. An image may be helpful to the director in using punctuation to provide tension; the image is the rope in a tug-of-war. When both sides in the game are momentarily evenly matched the rope does not move. If an audience saw only the rope there would be a static picture. However, when the motionless picture is combined in space with the two pulling teams, and combined in time

with the memory of physical movement and the anticipation
of future physical movement, the rope is seen as tension
and potential. If the tug of war and the held breath serve
as images for any kind of stoppage, even for the large stop-
page of a whole medium of movement for a necessary rest, the
stage director has in his grasp the potential for very dynamic
and continually flowing life-like production.

3-Summary Conclusion: Dynamic Flow and Balance Punctuated and
Phrased to Maintain Impression of Continuous Life

The challenge of this section is to consider phrasing a
play with minimal stop action, of either the mental or the
physical variety, and to think of movement as ebb and flow.
When the physical movement is kinetic the mental movement is
potential, and vice versa. In effect, there can be some sort
of alternation of phrases, first physical movement statement,
then verbal or mental movement statement, then physical
movement statement again. One movement can comment upon the
other simultaneously, or one can comment on the other alter-
nately. Units are hence set up, not with walls or moats
between them but with a baton as in a relay race. The baton
of movement is handed now to the words, now to the body
movement, while neither stops completely. The point at
which the transition takes place is punctuation, setting up
memory units without providing gaps in the continuity. Such
structuring, though derived from a life principle, is not
life, it is art. Life does not pause periodically to sum
up, except in very large ways, such as in the change of the

seasons. Art carefully selects its meaning, its pointing, and its hesitation to provide a cumulative structure that mimics life in part, but primarily provides structure that allows for a series of meaningful points to be made by the content of words and movement.

B. More Dynamic Movement Meanings Through

Mimesis, Metaphor, and Symbol

The hunt for and the application of moving sources for meaning through mimesis, metaphor, and symbol can help the director to create more dynamic movement meanings. To do this seems to require a closer definition of the kinds of movement and some specific and typical applications to the stage play.

1. Extended Definitions of the Three Kinds of Movement Meaning

For convenience this study has said that movement can be said to convey meaning in three ways: by mimesis, by metaphor, and by symbol. The three ways often overlap both in category and in experience. To some extent, also, there is a continuum that ranges through the entire set of categories including abstraction, without any distinct break in kind. In short, the distinctions of three kinds are more for the practical purpose of providing a guide to the creation of movement meanings than they are supposed to be philosophically distinct categories.

a) <u>Mimesis Defined</u>.--The first category, mimesis, may be simply translated as "this is that." What appears on stage is made to resemble real life as closely as possible. Belasco is said to have taken an actual restaurant and placed it on stage, complete with the working toilet. Antoine is said to have placed a real side of beef on stage, possibly complete with the working flies. Contemporary directors buy real furniture and properties to dress their setting. Several Russian directors are said to have experimented with having plays in their natural settings in a house, in a garden, or in a factory. The logical result of trying to present or to copy exactly is the motion picture film. Through it the audience may be transported to the exact place at the appropriate time, and the close up can reveal the details of the real object. Even the actors are often "real people" who have never acted before. This step really precedes mimesis in the continuum of types of movement meaning since it presents the real rather than an imitation of the real. Mimesis really starts at the point of being "true to life" rather than being life.

Where the director is unable to put the real life object before the eyes of his audience, he often goes to great expense to research and duplicate what was existent in the times. Of course Hollywood is famous for such reconstruction in its film extravaganzas. Where the real life human being is portrayed by an actor everything possible is

done to make him look and sound unlike an actor. His
motivations and actions must be true to life just as if
his character were real rather than fictitious. His acting
must be an accurate imitation of human behavior.

The achievement of this human behavior gives rise to
two methods. Either the artist duplicates the inner feelings
and motivations which in turn purport automatically to
reproduce the outer form, or else the actor reproduces the
outer form of symptoms and symbols directly, and to some
extent they may reinstate the inner feelings. Whether the
director uses the first or the second method, he still hopes
for the same result, that the acting give the impression of
being a real life experience for the audience. Of course, this
study suggests that a knowledge of the outer form is essential,
in order either to reproduce it or to recognize it when it
appears.

Within the mimetic category of "this is that" fall
movements that mean themselves. Usually business, such as
sewing or setting the table, means itself. In mimetic
performance the attempt is to use the business as itself,
that is to make it as life-like as possible. In effect, in
strictly mimetic meaning, there is only one statement, "this
is that"; life on stage is as near as the director can make
it to life out in the world. Such reproduction of life on
stage is probably communicated to an audience by familiarity
and empathy. As a familiar activity is duplicated on stage,

the audience motor responses are similar to those of the
actors, and the familiar activity reinstates a familiar
emotion. Everyone feels right at home.

Of course, strictly mimetic meaning is incapable of
making comment upon itself except as the audience already
has a point of view about the familiar activity on stage.
To present a comment, a contrast, or a point of view other
kinds of movement meanings, or else mimetic movements that
have established emotional connotations and hence can be
used contrapuntally with script meanings, need to be
employed.

b) Metaphor Defined.--The second category, metaphor, may
be simply translated as "this is like that." What appears
on stage may resemble real life or not, but some essential
qualities or dimensions of the move have been abstracted
from some other source, a source other than exactly what
the character would do were he faced with the stage situation
in real life.

The fundamental distinction of the metaphorical meaning
is the existence of analogous parts. Some object in life or
in art serves as a graphic or a moving image for the
director. Rather than merely letting such an image vaguely
influence something he calls the "mood" of his play, he can
let various components of his image be replaced by various
components on the stage; he may duplicate the rhythm, tempo,
kinetic action, potential action, shape, color, or emotional
qualities of the original image.

How this meaning conveys itself to an audience may be part empathic and part intellectual. The shape, rhythm, tempo, emotional overtones, and physical action of an actor or group of actors may provide empathic responses in the audience similar to that felt when perceiving the original image from which those qualities were abstracted. When these components are translated into body movement, the empathy with the body may set up additional emotional associations. The director may easily run into conflicting empathic responses. His image may be calculated to produce one affect upon the audience, but his choice of body action to carry that image may already be a natural symptom or symbol of some other feeling.

The way in which the metaphor carries meaning intellectually is by making the audience aware of the source of the movement. If a play is set at the sea shore, and moving water is an integral part of the story, the director may block a sequence of moves in which people are in some way like ocean waves. The audience can see, in the context, where the movements were derived. By seeing the analagous relationship, the audience takes pleasure in uncovering each additional nuance of relationship. It may also feel the movement empathically but in addition it can literally engage in the intellectual comparison of "this is like that."

The advantage of the dimension of metaphorical meaning is that two familiar things in life can be compared or contrasted to each other to give depth to the primary meaning.

To say people are like waves, or like swings, is to allow
for editorial comment. The audience is forced into a
perspective on the character and the situation. Instead
of merely empathizing, feeling into, or recognizing human
behavor, it can recognize and feel what a director chooses
to say human behavior is, should be or could be like. The
example has already been given of the comparison between
an adult walking down stairs followed by a child walking
down stairs in adult clothes. Given a careful treatment
and an appropriate context, the analogy is completed by
the audience much as a problem in algebra. X is the
personality of the adult. The unknown quantity is supplied
by the comparison. The clothes are equal to the clothes,
the stairs to the stairs, the personality to the personality.
Therefore, by analogy, the adult has a child-like personality.

Of course the logic in analogy is non-existent; proof
by analogy is no proof at all; however, to the audience,
the conclusion is inescapable. A statement of relationship
has been made by the director and for the purposes of drama
the audience usually assumes the statement is true. An
analogical movement is emotionally much more convincing
than a logical statement, for the audience thinks it is
seeing visible proof.

In searching out additional metaphorical meanings to
movement, the challenge to the director is to make his
moves more alive, more dynamic. To do this best, the
director should locate moving metaphors drawn from objects

or activities in life whose motion is appropriate to the scene.

c) Symbol Defined.--The third category, symbol, may be translated simply as "this stands for that". It would seem that symbolic movement in its extreme form would be the least useful of the three categories; it would provide movements that convey not only empathic meanings already native to them, but specifically convey verbal meanings as clearly as does speech.

However, in a very important way every movement on stage is a symbolic one. Even in mimesis a real life move is not seen. The imitation stands for the move that would be made in life were the real life circumstances the same as the circumstances of the play. Again, in metaphor, the wave-like body movement stands for the ocean waves; of course, the metaphor makes the additional comment that there is something to be learned from the comparison of the character to the wave. However, in a strictly symbolic way, the moves are not considered for their resemblance to human behavior or for their resemblance, and comparison, to other moving things in nature. They are considered for what facts, information, or relationships they convey directly to an audience.

For the extreme of symbolic movement, it has been seen that Oriental and Polynesian dances do have an approximation primarily in a hand gesture sign language. Often the meaning of the gesture is derived from either a mimetic or metaphoric movement. The hand makes a circle; it is the world, or the

moon. One shape is analogous to another. The hand rises and describes an arc over the head; it is the passing of the sun during a day; the arc of the hand is analogous to the arc of the sun. However, such gestures either need a strong context to give them specific meaning, or they need standardization through consistent usage. The point for the stage director is that he also may give a context to and standardize movement symbols to a limited extent within a given production.

To achieve symbolic meaning in any complete way would be to create a language that had a grammar, syntax, and vocabulary with dictionary equivalents. Such a language could be translated into other verbal languages. Such a language would have as its aim conveyance of intellectual and emotional ideas and would involve movement from which most of the empathic content had been drained. Such an extreme, as has been suggested in the chapter on dance, would merely be a duplicate of a verbal language and probably undesirable except for those who are deaf and dumb.

However, there are alternatives to a complete language of movement. In any culture's gesture vocabulary there are numerous signs with which a director should become familiar. The shoulder shrug, the hand point, the hand shake, the fist shake, or the nodded head all have very specific meanings to the American public. There are numerous other signs that a director might well compile in order to realize the potential for direct communication by gesture in his own
culture. Of course, the director fears he may fall into
cliche movement by the use of standardized gestures. This
will happen only if he is a cliche director. Knowing how
to vary the cliches according to the play's circumstances
and style, the character's personality, and the metaphorical
possibilities will free the director from, not bind him to,
cliches. However, he needs to know the cliches to begin
with. After all, a cliche is merely a standardized form of
communication. To shun it as a basis for meaning is to
discard perhaps a third of the meaning possibilities for
movement.

d) Mimesis, Metaphor, and Symbol Defined as Part of A
Continuum.--It can be seen that the three categories of move-
ment meaning are really not distinct but form a continuum.
To illustrate the continuum, more significant mid points can
be added. Perhaps a graded sequence of steps could be some-
what as follows:

The most extreme mimesis is really not mimetic at all.
Actual life is presented on the stage. The audience is
looking in on real people whose movement is natural though
inhibited, cultural, unplanned, and incidental. The next
step is exact replica. The performers know they are acting
but they try to forget it and act as they would in real life.
The movement may consist of carefully reinstated body symptoms
of inner feelings or it may consist of the result of the
creation of an inner life of a character. It is seen that
each approach has its danger; the symptom may be inaccurate
or the inner life may be replete with an actor's inhibitions
that impose a stilted and repetitive movement pattern
upon the body.

The next step in mimesis is to distort the real to make
it large enough to be seen and simple enough to be discerned.
Such a step is often called selective realism.

Still within the realm of natural movement is the
presentation of symbols for inner states. Through social
custom, certain bodily attitudes have become so closely
associated with certain emotions that they are thought of
as being innate, universal symptoms of the emotion. Some
of these attitudes will appear in the actor from simple
internal duplication of feelings, but many will not appear
without a specific knowledge of the form of the outer
expression.

The next step is a distortion of the natural symbol. The
body attitude, or gesture, becomes stylized for the stage.
It is simplified, enlarged, and adapted to the circumstances
of the character and the play.

At this point in the continuum metaphorical meanings
begin to be inserted. Perhaps the first is the simple trans-
lation of mental motion into physical motion. The words
show fear, or retreat, so the body moves back. The move is
still a natural one for fear, but it is not an inevitable
one. The move is both designed and natural.

The next coloration of move would be through the use of line patterns such that lines, abstracted from something exterior to movement, will provide a mood for that movement.

The next step is the conscious adoption of a specific metaphor from which to abstract elements that will unconsciously arouse the audience; allied is the use of metaphors which will arouse the audience while it is aware of the abstraction and can consciously use the image for comparison.

When the images in movement become habitual, so that no conscious translation needs to be made, the movements become symbols. The move is no longer thought of in terms of its derivation; it conveys a specific meaning directly.

The next step, hopefully avoided by the director, is cliche: symbolic moves that are so habitual in the culture that they cease to create either interest or fresh meaning. It is at this point that the continuum may come full circle. The method actor, creating mimetic movement through thought, without attending to form, is apt to recreate on stage mostly culturally acquired, unconsciously cliche symbols thinking that he is creating spontaneous symptoms of inner feelings. Of course, this study maintains that even cliches of movement may belong on stage if they are the director's conscious choice from the continuum of possibilities.

2. Application of the Three Kinds of Movement Meaning

When the director has absorbed the principles of movement

from his own culture he still has the problem of designing
specific movements derived from his script, his own ex-
periences, and the continuum of types; principles do not
automatically turn themselves into practice. For this
reason some specifics of each kind of meaning will be ex-
plored. The purpose will be to provide some typical
solutions, some specific suggestions, and some summary
conclusions, rather than a complete coverage and classifi-
cation in each category. All that is intended is a spring-
board to creative, meaningful, and dynamic movement.

a) <u>Mimesis Applied</u>.--Most of what this study has to say
about movement as mimesis has been said in the last chapter
about dance, pantomime, and psychology. It remains here to
clarify the findings concerning the communication of emotion
and attitudes, and to apply mimesis in three examples. The
three examples are theories of action and reaction, of
three part motivation, and of evolution from inner thematic
and character purpose to outer form.

1-Mimetic Emotions and Attitudes Differentiated. The first
part of this study has shown that both Gassner and Dietrich,
among others, tend toward the point of view that all emotions
have substantially the same symptoms, that the situation in
context is needed for the emotion to be identified. This
study has brought to bear the opinions of several psychol-
ogists, and others, who seem to oppose this point of view,
notably Campbell, cited in the last chapter as believing
that every feeling has an appropriate body expression.[1]
The conclusion of this study is that the two schools of
thought are not really talking about the same things.

The symptoms of emotion are to the first school merely
the organic symptoms such as heart beat rate and strength,
breathing rate, and perhaps also the results of such tests
as eye pupil dilation, galvanic skin response, or amount
of perspiration secretion. Such symptoms are undoubtedly
present in any display of emotion. Such symptoms are un-
doubtedly at the basis of all emotion. However, the
culture, the arts, and some psychology seem to have found
reasons to differentiate emotions on the basis of broad
categories such as joy, fear, hate, or disdain. Psychol-
ogists such as Campbell, pantomimist's such as Aubert, and
dancers such as Humphries seem to feel there is a communicable
body difference in these emotions. This study then concludes
that another term is needed to supplement the term emotion,
to designate what Campbell, Aubert, and Humphries are talking
about. Let the term be "attitude". The term can refer to
the overt symptoms of a differentiated emotion or else to
something that is in addition to emotion. The point is,
however, that such attitudes seem to be expressed in fairly
consistent patterns of neuro-muscular response without any
conscious effort on the part of the person reacting. There
seems to be a difference of kind, which may only be a differ-
ence in degree, between this natural bodily expression of

---

[1]Campbell, "Your Actions . . ." op. cit., p. 27.

attitude and a culturally accepted symbol for the specific attitude. In any event, such an expression of attitude is not derived from art; it is distinct from an abstraction, distillation, exaggeration, or simplification of a natural attitude manufactured for the purposes of communication. Such natural bodily forms appear to be based on reflex and the result of activity of the autonomic nervous system. They appear also to arouse similar reactions, by empathy, in an audience that witnesses these attitudes.

A context can certainly distort or change many meanings. A relatively blank facial expression, an undifferentiated body expression of emotion, or a general body attitude that is basically protective, expansive, negative, or positive can easily be interpreted in a number of ways given a number of very specific contexts. However, this is not to say that certain gross bodily attitudes, and/or subtle body movements, are not usually found accompanying certain specific mental or emotional attitudes in real life. Studies quoted in the last chapter tend to establish such typical accompaniment. In fact, as has been seen, both dramatists and psychologists alike have noted, or made good use of, the recognizable difference between bodily attitudes and verbal statements that provides contrast in meaning.

The basic symptoms for emotion, then (heart beat, muscle tension, breathing rate) seem to be merely preparation for action; they are getting the body prepared for whatever

physical movement may be necessary as a reaction to a
specific stimulus. Body posture, movement, specific
rhythms of breathing, the part of the body that starts a
movement, and actual gesture all seem to be motor activities
largely controlled by a combination of the autonomic ner-
vous system and conditioned reflexes activated by what the
sensory perceptors perceive. What is not autonomic still
appears to be typical depending on what motivation is
aroused as a result of perceiving the stimulus. In fact,
a spectator may actually read into another person's re-
action what the basic motivation is without seeing the
stimulus. The specific stimulus usually cannot be guessed,
but often the <u>kind</u> of stimulus is clear. Of course, art-
fully simplifying, spreading out sequentially in time,
exaggerating in size and shape, or removing inhibiting
influences from a specific reaction will all help to
clarify what is basically a built in and very early
aculturized movement.

2-A Theory of Action and Reaction: Suspense and Power.
The ability to recognize a reaction or a motivation without
seeing the stimulus provides material for a specific mimetic
movement suggestion. In each human interaction there is a
pattern of action and reaction. The reaction becomes an
action for subsequent reaction. The ability to discern in
a reaction its kind of motivation and to some extent its
stimulus provides the basis for a perspective and a suspense.

If the audience sees both the action and the reaction, its view is objective theatre. If it sees primarily the action the view is normal film. However, if the stage director can reverse the usual order of procedure and have the audience watch the reacting person, a new point of view for the action can be obtained.

When only the expression of the reacting person is seen the audience has a subjective view, to some extent seeing only what the reactor reveals and accepting his evaluation of the action. The audience is also held in suspense. Being able to tell only in general, the audience wonders what the specific stimulus is. When it is revealed, audience satisfaction is attained. A stimulus appropriate to the reaction usually results in supported drama while stimulus inappropriate to the reaction usually results in dramatic irony or in comedy. For example, adult fear whose cause is revealed to be a two year old with a water pistol is comic. However, to have such a comic result it can be seen that the body attitude, e.g., for fear, has to be recognizable.

In action and reaction there seems to be a sort of dynamic ratio at work. This study has already employed the physics principle, for every action there is an equal and opposite reaction; a movement appears no stronger than its opposition. There is an additional application where motivation is involved; a move is no stronger than the purpose, or the resolve, of the mover. Power on stage then can be

considered a total of purpose, plus mass to be moved, plus actual movement against an opposition. In effect, this relationship is another statement of the ancient idea of the necessity of dramatic conflict, a statement dressed up in terms of psychologically motivated movement. The more purpose, the more emotive and emphatic value there will be to the power. The more opposition, the greater that power appears.

It is seen, then, that if the director plans accurate symbols and symptoms for an actor's reaction, then reveals that reaction without revealing the stimulus, he can create both a unique point of view and a suspense about the stimulus. If he can also insure that both the stimulus and the reacting character are part of purposive masses moving in opposition his action and reaction will give the impression of power.

3-A Theory of Three Part Motivation. The first part of this study mentioned a three part motivation which will now be clarified and summarized. Only two of the parts are psychological. That is why an overview of the script by the director is necessary to insure that all three kinds of motivations are present.

Internal. The first kind of motivation concerns the establishing of an inner need, response, or impulse. Something interior to the body causes a movement. The senses may record the smell of smoke, the stomach may create a feeling of hunger, or the lungs may record a shortage of

oxygen. Some internal impulse starts a reaction pattern sequence that changes body set, breathing, and gesture.

External. The second part of the three part motivation is external to the body. If the inner impulse was caused by a body function, e.g., the stomach reacting to a need for food, the new body set can eventually result in the eye taking over in the search for food. The external motivation would be a source of food. For the motivation to be complete and to communicate to the audience, a body movement toward the external motivation needs to take place. For complete clarity the action should be finished, the food acquired, the beginning of the action tied into the end, and the inner impulse quieted, or brought into balance.

The inner impulse may be in response to an outer stimulus, e.g., a door slams, the ear records, and then a reaction pattern takes place. In this instance the outer motivation is presented to the audience before the inner. To complete the action, the reactor needs to do something relative to the door slam, then both an outer and an inner focus has taken place again.

Ideational. The third part to motivation is an extension by analogy, movement motivated by the purpose of the play. The individual's purpose can be said to create the form of his pantomime; the play's purpose can be said to create the form of the director's blocking. To be sure, all purposes derive ultimately from the overall purpose of the play,

and all movement should seem to derive from the special purposes of the individual in a particular scene. However, large movement patterns seem to have a special dependency on the overall theme and plot of the play.

It is this study's contention that every stage movement can and should have all three motivations. The play may motivate a director to get an actor near a door in order for him to be shot in the next sequence. That actor should also be motivated by some inner need and some exterior goal to get to that position near the door. Of course, these inner needs and outer goals should be integrated into what the character would want both in the particular scene, and in his function as a character.

4-A Theory of Inner Purpose Determining Outer Form. Character movement seems to be the result of a composite of causes. In effect, ideally each character's every observable movement should be the result not only of the kind of person he is and of the situation in which he is at present, but also of an inner felt need that is expressed outwardly, of an external goal that is evident to the audience, and of a theme and plot requirement of a play. Of course the expressive qualities of the movement (its line, form, mass, expressed symptoms, metaphor, or symbol) are assumed to be attributes of the movement that stem from character, situation and theme. Hence, all these considerations should result in movement that will successfully depict the inner purpose in the outer form.

b) <u>Metaphor Applied</u>.--The purpose of using a metaphor for movement is similar to that of using a metaphor in speech. The good metaphor clarifies, deepens, and broadens the meaning of a particular scene by adding its meaning to that of the movement. By careful use metaphor can bring the same depth to movement that it does to literature. Of course the director is wise to use a moving metaphor that will take advantage of movement's greater emphatic and empathic meaning. An analogy will serve to show the point of view of this study concerning the relationship between the moving and the static metaphor. On stage, movement derived from a moving metaphor is apt to be as more dynamic than movement from a static metaphor as the motion picture is more dynamic than a series of slide projections.

This section will deal with some sources, some problems, and some examples of the moving metaphor that may serve as a guide in the director's selection.

1-Sources of Moving Metaphor. This study suggests looking for more images of objects or processes which move. Movements of water, fire, and air, of machine and growth, and of basic human maneuvers such as fighting, love making, and survival, of sporting activities, or of narration in literature can all provide material for the moving metaphor. When abstraction of pertinent rhythms, movements, or forms has taken place and the abstracted elements given to analogical parts of a stage composition, the use of the
moving metaphor is complete.

2-Three Poor Metaphors: Mixed, Esoteric, Trite. The poor movement metaphors are similar to those existing in literature; they are the mixed, the esoteric, and the overworked, or trite. Ultimately, the discretion and experience of the director will determine how successfully he avoids the poor metaphors, but some guide lines are in order.

The mixed metaphor is most apt to occur when the theme of the verbal script carries one image and the movement pattern carries another. An example may be drawn from a particular production of Albee's American Dream. The theme of the play as written has as its image a strong, handsome, but emasculated male individual. The American dream is embodied in a mythical hero. Albee makes the point that the so-called rugged individual, the handsome hero, the idol of America, is really a shell. This hero is his symbol, and a handsome young character embodies that symbol. Here is the playwright's analogical construction: This character is to the play and to other characters in the play as the American dream is to America and to other Americans.

In the production in question the director created a setting that resembled in detail a monopoly game board, with the sets of cards and a die providing furniture for the room. To some extent the play's movement pattern resembled movement about the game board. To the director, the American dream was the dream of going from rags to

riches, the Cinderella story, or some such variety of the materialistic hope.

Witness the mixed metaphor in full bloom; the playwright has one American dream in mind, the director has another. The particular ideas, themes, and interactions of the playwright are simply not expressed by the static and moving images of the director. If the director had tried to create analogical relationships he would have seen that although his metaphor was derived from the title, the director's was an American dream, it was not derived from the content of the play. He could not match his image to his movement with the A is to B as C is to D formula. There were no analogous parts. Consequently the audience almost had two simultaneous and different plays, one the playwright's and another the director's, with neither helping to interpret the other.

An example of what might appear to be a mixed metaphor, but was so patently and uniquely obvious and original in context that the mixture went unnoticed, was employed by Marcel Marceau in a pantomime about a butterfly. Marceau is the man hunting, net in hand. He sees the butterfly and his head takes on the motion of the butterfly's flitting as it darts up and down. Meanwhile, his eyes remain the eyes of the hunter, looking at the butterfly in flight. When he finally catches the butterfly his thumb and forefinger are those of the hunter extracting the butterfly from the

net. However, the rest of his fingers become the fluttering wings of the butterfly. Then, as he watches the butterfly, the fluttering wings adopt the rhythm of a human heart beat as a recognizable metaphor for a living butterfly. Then the tempo of the beat decreases until the fluttering stops. The fingers have become the wings and the wings have abstracted from the human heart beat its rhythm, and used the rhythm in its wing movement. Apparent death is depicted by the wings stopping beatting, the wings now representing the heart.

The above example is not in the same class as the mixed metaphor of The American Dream. In Marceau's pantomime one body has to portray two beings: the hunter and the butter-fly. Certain portions of the pantomimist's body, from time to time, assume the rhythm, form, direction, or tempo of the butterfly. In effect, there is no mixture of metaphor but a metaphor within a metaphor: The hand moves like a butterfly wing and the wing moves in the rhythm of the human heart beat.

The fingers have established so well the movement of butterfly wings that the audience accepts the fingers as wings. When the wings then abstract from the heart beat its rhythm, there seems to be no unbelievable jump. Such imaginative, and accurate, use of analogous parts can certainly increase the director's and the actor's powers of communication by movement. However, truly mixed

metaphors do not communicate imagination. They only succeed in confusing or in directly misleading an audience.

The esoteric metaphor is perhaps more common than the mixed. If the image the director has in mind is too remote from the audience's experience for the audience to see the relationship, no comparison is possible. However, the audience does not have to know what image the director is using if he has chosen an image that will supply appropriate empathic response. Perhaps he has in mind a bird in flight. His actor uses this image; leaping and fluttering about on stage fulfill it. If a feeling of weightlessness and effortlessness is achieved by empathic response, the audience may feel like soaring; its emotions be joyous. However, the audience may never know the director suggested to the actor that his arms are like wings, his fingers like feathers, and his body is as light as air, even as a bird's body appears to be in flight.

A more remote form of esoteric metaphor is usual. For example, should the director choose the image of the bird for lightness, and the actor use the image to provide a walk, the bird walk may provide a very un-soaring response from the audience. A bird stalking about seems proud, moves in staccato rhythm, and is quick to shy away. In a human being, who does not have the light appearance of a bird, nor the fragility that makes quick movement seem shy and protective, the bird-like movement may appear mysterious,

portentious, overweeningly proud, and somewhat obnoxiously precious. In short, failure to recognize a metaphor may not be as misleading to the audience as a misapplication creating empathic response, which is unwanted.

The problems of overworked, or trite, metaphors are so very relative to the particular play and to the background of the audience that little can be said. Perhaps one guiding principle will suffice for the overworked metaphor. The director needs perspective so he does not fall in love with his metaphor. If it is one which is used to interpret an entire play, then it should probably not be worked out to its most minute detail in every movement, but merely provide the over-all shape to the blocking scheme or to the characterizations.

3-Two Moving Metaphors: The Pendulum and The River. The pendulum serves as an appropriate metaphor to suggest dynamic relationships between punctuation and the moving phrase, while the river supplies interesting suggestions for dynamic flow relationships among depth, tempo, mass, and continuity.

The pendulum provides an image to stimulate a partic- ular conception of the relationship between the dynamic phrase and its punctuation. Therefore, to apply the metaphor adequately the director first needs to consider the nature of the phrase itself. The phrase, according to the dancers, is a time unit derived from the duration of one speaking
breath. The idea of the phrase has been incorporated into music and speech where it is still a unit of meaning of approximately a few seconds' duration.

The phrase has a beginning, middle, and end. It usually contains one complete unit of rhythm and one major accent somewhere within it. Also it usually begins with an attack and ends with some punctuation. Phrases are sometimes separated by a time gap; other times they are set apart from each other by the recognition of a repeated pattern. Each phrase has a similarity of structure, if not of content, that makes it appear as a cell of meaning.

The phrase has also been used as a metaphor; any meaningful units of varying sizes, as long as they have recognizable unity as building units in some larger structure, can be thought of as phrases. In a sense, an entire play is a phrase, within which there are acts, French scenes, speeches, sentences, and clauses or prepositional phrases which can all be structured as phrases within phrases. To change the metaphor to an organic one, the director could think of these phrase units as cells which make up organs which make up a living body.

The phrase can be thought of as being either dynamic or static. If the director thinks of his units as still picture compositions, no matter how often he changes the picture the meaning is conveyed in static relationships, and the movement to change pictures is fundamentally a dissolve-blur.

If he thinks of the meaning within the phrase as carried by moving thoughts, moving bodies, and moving plot, then the body of the phrase is motion and the punctuation is static.

One way to keep phrasing intact without having static moments is to employ the metaphorical relationship of the pendulum. The pendulum moves through a swing that has certain interesting idiosyncrasies. In perfect gravitational balance it is at the middle of a swing, when it is pointing straight down. At that balance point it is swinging the fastest. When it comes to the highest point in its swing it is in its greatest state of imbalance and moving at its slowest rate, actually coming to a stop at the top of the swing. The pendulum moves from one state of imbalance, rapidly through the point of balance, to another state of imbalance. Hesitation takes place at a turning point, not during the main flow of action.

To see the pendulum remain posed at its highest point for an instant can create a feeling of imbalance that must be resolved. If the imbalance is not resolved the viewer can become uncomfortable with the defiance of gravity and of natural expectancy. Extended in time, this discomfort could become decidedly unpleasant. If the hesitation is momentary, held only long enough to see the imbalance, the position can arrest attention and set up an expectancy. In motion, the pendulum fulfills the expectancy. However, it swings past the state of balance and proceeds to a new imbalance, a

new potential. The actual balanced position is retained for the shortest period of time. Should the pendulum remain in its down position, it would be restful, but ultimately very tedious.

If the director thinks of his phrase as being analogical to the swing of a pendulum, he has a dynamic concept. At the turning point in each phrase, when the subject changes, when a new breath is taken, when a new character enters, or when an old character exits, or whenever a point for some slight change in motivation or theme takes place, there is where the director can afford his hesitation, or turning point. The pendulum at that point is the most potential; the phrase at that point can move into a new swing of movement and power. The pendulum has the greatest kinetic force in mid swing; the phrase can be moving the fastest, or the greatest, or the most meaningfully, at mid phrase. The pendulum slows down as it approaches the turning point and can be seen easier when moving at a slower rate; the phrase can slow down just before making an emphatic point. The pendulum hesitates at the end of a swing; the phrase can hesitate at its conclusion so an audience may quickly see what the last phrase meant before the play moves on to the next one.

In a sense, the pendulum is always in balance. The force of gravity opposes the inertia of the weight on the pendulum. When the forces are equal, the pendulum

hesitates at the top of the swing. Similarly, in a phrase,
an audience must see forces at work making the action
move through the body of a phrase. The audience must see
one force come up against another force such that one or
the other becomes redirected. A body comes up against a
wall and changes direction; a will comes up against another
will and retreats; a resolve comes up against an opposing
resolve and a mind is changed; or a train of thought is cut
off by the intrusion of another train of thought. All
thought is cut off by the intrusion of another train of
thought. All of these, of course, are typical dramatic
conflict situations.

If a pendulum is left swinging, without more power than
inertia and gravity, it soon stops because of the friction
of air and moving parts. Some basic motive power, weights
or a spring, overcomes loss of inertia and keeps the
pendulum swinging. The phrase needs within it a strong
motive power, will, action, or underlying purpose, usually
embodied in the main character, to keep the body of the
phrase moving, and to supply the content and direction of
that movement. To keep the phrase dynamic, the "over-
coming" force must seem alternately stronger then weaker
than the "balancing" force.

As with any metaphor, this one breaks down eventually.
No director wants each of his phrases to have the same
length, dynamic quality, force, and location of the fastest

movement or turning point. Of course, the connotations of each swing of the pendulum are of chief interest here rather than its stable rhythm. Some phrases might climax early or late, some might have several beats to them, some might not hesitate even as long as the pendulum and hence resemble waves of movement while others might come to a complete stop for as long as a full phrase. The point is, however, for phrasing to exist there has to be some recognizable unit with some principle of repetition within its structural variety. The pendulum is merely one image to help provide the director with a dynamic concept of a moving rather than a static compositional unit.

The river provides an image for dynamic flow on stage because it also seems to reflect the dynamic flow of life. This flow may be punctuated, slowed down, or speeded up, made to hesitate, to become staccato or wave like, to be grouped rhythmically, even to be stopped temporarily. However, if the flow stops for long there ceases to be life. The river seems to fit this flow of life and to interpret life in art. The assumption is that the flowing water is analogous to the continuity of life and to the flow of stage movement.

When a river is wide and deep its movement is slow but massive. When the river is narrow and shallow its flow is rapid and turbulent. When the flow of life in a play con-sists of broad interests and deep thoughts or motives the

movement pattern can be large, general, slow, and smooth.
When emotions come to the surface and are restricted by
the friction of opposition on all sides, then accompanying
movement is turbulent and rapid. When a river meets obstacles,
such as rocks, it flows around them, becomes turbulent at
the points of impact or, if the river is deep enough, it
flows over them with only a slight rise in the water. The
staccato movement of the river is analogous to the movement
pattern in a rapid repartee sequence, or a sequence in which
many little obstacles are in the way of the action.

Sooner or later the river comes up against a dam. For
a while the depth increases, the height mounts, the pressure
becomes strong, then either a small amount of water pours
through a sluiceway or over the top, or else the dam breaks.
In scenes where emotion is held back, a smooth surface is
apparent, under which there are whirlpools of feeling, and
mounting pressure. In pantomime, a large breath is taken
and only a little bit of it is used in speaking, creating
the impression of withheld emotion, an impression like a
dam withholding water. In blocking, a strong character or
a potential situation is analogous to the damming of the
river. A continual withholding of movement maintains
potential with just enough water or feeling allowed to
slip by to maintain flow. Too much pressure and the entire
flow of action that had been restricted, breaks loose into
a swirling, dashing, dynamic climax scene.

A scene with a small mental content is the shallow, wide, rocky river. Many small, insignificant turbulences occur which are fun and mildly exciting but not vital. Such movement is typical of comic sequences.

Such comparisons between the flow of the river and the flow of movement can be made as long as the director chooses. The important reason for using a river is to replace in the director's mind the kind of movement the slide projector suggests, that dissolves between still pictures, with the movement of a dynamic flow. Throughout the life of the river, and the life of the play, there are obstacles to the flow, but flow never stops for long, and even when it does stop it is replaced by turbulent pressures. The director can have as dynamic a production if he thinks of his play also as a continuous action into which he may insert obstacles, conflicts, and smooth passages, an action which he may shape and restrict or even temporarily retard but whose flow from beginning to end never really stops in either emotional, mental, or physical movement.

4-Metaphor Summarized. The director, then, has a special freedom and a special responsibility with metaphor in movement. He can draw into his production meanings from anywhere in the mechanical, natural, or artistic world to compare and contrast with the meanings in his script. He also has the responsibility to see that his metaphorical relationships are pertinent to his total production and

can be clearly "read" by his audience. He also has a live option to take advantage of the greater attention getting and expressive powers of the moving picture. The director can draw his metaphors from anywhere in the universe in flow around him to keep his production dynamic.

c) Symbol Applied.--Strictly speaking, all forms of stage movement are symbolic; each occurrence on stage stands for something on stage. But in special ways certain movements are almost a sign language communicating meanings clearly to an audience of any one culture. The director can try to create symbolic meanings for his audience or use primarily movements that already have an established meaning. Doris Humphries' standardized gestures, such as bowing, genuflecting, or burden carrying, have been mentioned in the chapter on dance; in the introduction to this chapter additional symbolic moves have been listed such as the hand shake, head nod, and shoulder shrug. It may be a worthwhile project to list a great many such gestures and to catalog them. However, this study will turn to the more exciting notion of creating a language of symbols. 1-Limitations of Symbol Creating. By certain special uses of movement established during the flow of a particular production, the director may create special symbolic meanings, movements that say in a moment an entire context, a complex idea, or a special relationship. Such symbols may achieve in movement what symbols like The Wild Duck have

in the verbal language. Such a special language may call
upon metaphor, mimesis, or previously held symbolic
connotations to aid in its creation. But fundamentally
such a special symbol language is born from a context and
needs that context to sustain its meaning. Within a play,
or a given series of plays before the same audience, a
limited symbol language can be created. The symbols
can provide single foci for complex ideas, concepts, or
objects into which whole contexts of meaning are gathered
for the audience.

2-Levels of Symbol to Create. There seem to be, then, two
levels of special symbol that can be established, though
the method of establishing them is similar. One is the
smaller, simple symbol that stands, for example, for a man,
an action, a simple idea, or a hope. The second is the
larger symbol, that stands for the play's major conflicting
forces, themes, or ideologies. The former symbol can
often carry little or no meaning at the beginning of a play,
but is established and becomes a symbol by the end. The
latter, to carry so much meaning, probably needs to have
a metaphorical relationship to what it stands for right
from the start.

3-Method of Creating Symbols. The method for creating
moving or static symbols on stage is the same as the
method for establishing any language or equivalence, that
is, through repeated association and familiarization.

The totally unfamiliar seems to puzzle and confuse an audience. If that unfamiliarity continues it can become boring, irritating, ridiculous, or even fearful depending upon whether the object seems to be threatening or benign, strong or weak. This new object can become familiar through association with an already familiar object and gain associative meaning at the same time.

A simple static symbol for a character can be established quite easily. For example, an old man is always discovered on stage in his favorite rocking chair. During the last act the rocking chair is empty. Therefore, the old man is dead. The rocking chair becomes a symbol for the man by constant association. The empty chair draws attention to the missing element, the man. By such association and repetition any object can become the symbol for a character. If the object is also functional, providing a dimension to the personality of the character, the association is organic and more easily established.

Simple moving symbols can also be established quite easily. For example, in the song "Happy Talk" in South Pacific words are synchronized with gestures. The result is a childlike commentary upon the words, a commentary that is appropriate for the scene but is also a careful establishing of symbols that can be used later in the production.

A larger moving symbol also may put concepts into compact understandable units, for examples, a man's

character, the larger point of view he represents, or the moving relationships of the theme of the entire play.

The character symbol would be some repeated pattern of behavior such as a methodical routine for making an exit, a pattern of clumsy business, or a special moving relationship to scenery, e.g., a special way of coming down the stairs, that would capsulize the character's dominant characteristics. If a particular pattern is used each time a particular concept is discussed, a particular type of decision is made, or a particular attitude is enacted that moving symbol comes both to characterize and to stand for the dominant character trait or typical contribution of that character to the plot of the play.

By combining patterns of typical character behavior major character interrelationships can be depicted. By combining such related character movements with a single larger pattern, such as opposition, solidarity, advancing, retreating, joining, siding, encircling, rising, or falling, the specific use of the larger pattern can take on the specific meaning of the play's thematic relationship. By the end of the play the movement, such as encircling, can symbolize succinctly the basic changed or unchanged thematic relationship in the play.

A single example should suffice. From the beginning of a play a father is depicted as orderly, punctual, ceremonious, and self assured. Each time he enters he is tidily

straightening his clothes, checking and changing the clock
according to his watch, and adjusting a piece of furniture
an inch; all during the movement pattern dialogue is going
on (although the first time the pattern is presented
possibly it should be in silence to become established).
Some part of the routine, such as thumbs in the watch
pocket handling the watch, may be singled out as most
typical and become the master gesture for the character.

Surrounding this character and his character movement is
the movement of the rest of the family. The relationship
of servant to master has been accepted by them. They
enter from all parts of the stage, surround him, then move
in circular fashion around him as the object of interest,
hover, and perhaps even genuflect in their attempts to
cater to his needs. The way in which these characters hover,
combined with the script situation and lines, will create a
movement symbol for the major relationship of the play. By
the end of the play a repetition of the pattern will show
that the relationship is unchanged; a variation in the
pattern may show a new trend, a progression, or even a
reversal.

In effect, then, movement patterns can provide master
gestures for each character, master moving patterns for
each major character interrelationship, and a master move-
ment pattern for the most typical, most thematic, moving
relationship in the play.

C. Conclusion: Principles in The Use and Creation
of Movement Meanings

There seem to be at least two principles operating
in the successful establishment of new meanings to movement.
The first is that the director must start where the audience
is and carry it to where he wants it to be. He must start
with the familiar and the conventional and by careful
association establish a meaning for the new. He cannot
expect the audience to miss a step in the process and
somehow to jump to the new meaning and both to accept and
to understand it.

The second principle operating seems to be some
variation of "one thing at a time." To establish anything
new there needs to be a solid basis in the old. If the
movements are new the meanings had better be old. If
bizarre or controversial concepts are being presented, the
movements better be established ones. Too much new at a
time is apt to be confusing, puzzling, irritating, boring
or even fearful. The audience needs to know where it is
before it journeys to a new point of view. It will "go
along" to some extent on a new venture but not if form,
content, conventions, movements, and words are all new to
it. It seems better to vary one element at a time in
establishing the new.

Perhaps the most exciting aspect of creating new
associations, when the director can use a subtle touch, is

the audience's pleasure in vicarious creation. The audience
has been a part of a discovery; it has really been the one
to draw the conclusion that "this is like (or means) that".
Using a partial familiarity, a unique meaning, or a new
perspective on an old element the director can make his
production more hopeful, fearful, and exciting for an
audience than merely by using movement and words in their
established, conventional ways.

CHAPTER IX

A FOCUS ON THE PROBLEMS OF COMMUNICATING BY MOVEMENT

In composing his movement for a more dynamic stage the director has several special concepts that can assist or hinder his communication process. Those that this study wishes to explore further in this final chapter concern aesthetic and psychical distance, communication vs. expression, and the conventional limitations upon the stage director's creative role.

A. The Problems of Aesthetic and Psychical Distance

Aesthetic and psychical distance are often used as interchangeable terms. They refer to the special distance between an art object and a perceiver that makes him realize what he is watching is in a special world all of its own, not a part of the world of action and reaction wherein he must move and act daily. This special world in which the art object exists usually reflects the real world, in some way mimics, interprets, or abstracts its forms from the real world, but it is not a part of the chain of cause and effect in the practical world.

Of course a viewer can observe a practical object as if it were not a part of his real world; for instance, he
can view a landscape in terms of its formal, metaphysical, or symbolic relationships; he can see it aesthetically as an object for contemplation rather than practically as it affects his livelihood as a farmer, or affects the distance he must cover to reach his destination. In the second instance the view of the object is as an instrument. The viewer thinks of the object in terms of its instrumental value in his practical, or moral, life. In the first, the view of the object is as an end. The viewer thinks of the object as having intrinsic value for contemplation, and the object thereby becomes aesthetically distanced.

1. Aesthetic and Psychical distance Differentiated

There seem to be two kinds of distance which fit the two terms, aesthetic and psychical: distance from aesthetic, or formal, compositional elements and distance from psychical, or psychological, motivational elements of human interrelation.

a) Aesthetic Distance: Felt Distance from Formal Elements.--If an art object appears to be continuous with reality there is insufficient aesthetic distance, or, as this study will define it, the art object is underdistanced. For example, if a picture has no frame but is continuous with the wall of a building such that the picture's elements are thought of as belonging to the wall of the building, not to a separate entity called a picture, then the art object is underdistanced. The picture is thought

of functionally, or instrumentally, as part of the wall. If the art object is three dimensional and its formal elements are like those in the building, then there is also insufficient aesthetic distance, for there is no discernible individual art object; the aesthetic object is again continuous with the practical world.

On the other hand, if the formal elements in an art object bear no relation to the cultural environment of the art object, then the art object is overdistanced. The audience is involved in the object only to the extent of passing judgment that the formal elements in the composition are inappropriate to its environment. The properly aesthetically distanced object contains aesthetic, formal elements that are recognizably related to life in the cultural environment of the object. It may interpret life, distort it, bear geometric relations to it, or contrast in some understandable way with life's formal elements. However, this same object is clearly identifiable as separate from its environment, having a frame or limits to its form and some internal principle of integration and structure that is recognizably derived from life but is not continuous with life.

b) Psychical Distance: Felt Distance from Psychological Elements.--Psychical distance, on the other hand, is a term that can perhaps be best reserved for the emotional relationship between the audience and the human art object. In the

case of the play, the audience may psychologically identify with, or be alienated from, certain characters. This relationship is appropriate psychical distance. However, should the audience begin to be concerned with the actor instead of with the character the audience is overdistanced from the play; if the audience starts thinking of the character as a real person, and behaves as if he were a real person, then the audience is psychically underdistanced.

If psychological elements in a play are too life-like, or physically do not stay within the frame of the play, then the audience may think of the stage action as continuous with life, not life-like but actually life. Merely life-like is appropriate distancing; "Life-like" still involves an awareness of the illusion. When a play is highly stylized, even esoterically so, an audience may cease to think of the play as being life-like, and the audience, becoming overdistanced, may lose interest.

c) <u>Ideal Aesthetic and Psychical Distance</u>. The ideal aesthetic distance, then, occurs when the forms of a play are believable and understandably derived from life but are not continuous with life. The ideal psychical distance occurs when the actions of the characters could believably take place in some real or imagined, internally consistent culture in life, but are not thought to be actually taking place in the practical world.

2. Audience Reaction to Degrees of Distance

Ideal, or normal, aesthetic or psychical distance can be created or destroyed for an audience under various circumstances. The norm of audience reaction is for the audience not to try to interfere with what the characters do on stage; the audience does not get itself physically or practically involved even though it is somehow emotionally involved. If the audience felt it were watching a real life event the play would be underdistanced and the audience would behave quite differently. It would take sides, speak to the characters, enter the discussion, block the murderer, and generally interfere in the proceedings. If it were too polite or afraid to interfere it would still react quite differently to the real murder than to the stage murder. If the action becomes too real, seems somehow to be a real life event, not a dramatization, an unwary audience might try to interfere. If an audience even felt like interfering the play would be called by this study underdistanced. On the other hand, if the audience could not even get involved enough in the action to suspend its disbelief; if the action were obviously a play, and not close enough to reality for the audience to identify with the action, the audience would soon become bored. Such boredom is one symptom of what would be called by this study overdistancing. The problem of the director is to produce his play in such a way that neither

over nor underdistancing takes place.

a) Movement Tending to Over or Under Distance The
Audience.--One way in which this study feels a play becomes
over distanced is by undue audience attention to parts or
details of movement rather than to the whole. Then there
is not even an illusion of a unified reality; the play as
a whole is overdistanced. Sometimes the illusion is
broken and overdistancing takes place because one part
in the whole breaks loose from its context. The determined
audience usually tries to put the part back into its frame,
but sometimes annoyance with the ineptitude of the artist
gets the better of the audience's predisposition and the
play is overdistanced.

When the stage illusion is so complete that it is
thought to be real, underdistancing has occurred. If a
viewer tries to walk up stairs that are painted on a two
dimensional wall, the painting is underdistanced. If he
tries to stop the murderer from choking the little girl,
the play is underdistanced; if he tries to stop the leading
man from hurting an actress the play is overdistanced.

b) Audience Predisposition Toward Ideal Distance.--
Audience predisposition helps the director in his task.
The audience comes to a play prepared to have a gregarious
good time without interferring with the play's action. It
comes knowing that the play is not a real life event. It
comes prepared for aesthetic or psychical distance and
seeks to maintain the appropriate distance throughout the

performance. The director's knowledge of expected movement conventions helps him to help his audience maintain its expectations.

In the case of stylization, the audience predisposition again comes to the director's rescue. Wishing to maintain proper psychical distance, an audience can go a long way toward accepting the symbol as a depiction of, or commentary upon, a real movement. If the director's movement language is consistent so that his audience may enter into the spirit of it, almost any language derived from recognizable symptoms, symbols, and metaphors will be accepted by an audience. Only the unclear, the esoteric, or the inconsistent fatigues an audience and eventually overdistances it from the play.

3. Attempts to Lessen Audience Distance

Many attempts have been made by directors to break down the distance between the audience and the play, usually in order to shock or to teach.

a) Attempts to Lessen Distance that Increase Distance.-- Some movement conventions tend to overdistance a play with the intention of lessening the distance. Movements which bring the action of the play into the audience in a proscenium play are cases in point. Normally the audience has already psychically bridged the gap between the seat and the stage and has entered into the action of the play vicariously, as much as it wants or is able to. It retains its anonymity

as the audience. The director may feel his audience is not responding enough. Instead of looking to the inadequacy of his symbolic, symptomatic, and metaphorical movement language he decides to bring the actor into the audience to force the audience to take part in the action of the play. Such a director forgets his audience pre-disposition. The usual response to such a "gimmick" is a withdrawal on the part of the audience in order to maintain its distance. They physically pull back in their seats, they mentally retreat from the meaning of the play. If the actor is right next to them they tend to look at the floor or fidget in their seats or laugh nervously. If the audience likes the gimmick then the play was probably always over or underdistanced, no stage illusion had been created, and the audience is reacting to an actor close up, not to a character in a play.

However, an audience quickly readjusts to maintain distance. If the aisle is established as a portion of the stage the audience can accept it, providing the audience can see and hear the action well enough. When it accepts the aisle as stage the distance is set up anew such that the new aisle position no longer achieves any special underdistancing effect.

Another attempt is to lessen audience distance from some particular element in the play with the result of increasing the distance from the play as a whole. For

example, a sudden change in stage conventions or tone can shock an audience into special attentiveness, but the total result may not be what the director wants. The too violent murder, a swear word, a seemingly pornographic move, an actor joining the audience, or a physical contact with the audience will all create a shock and involve the members of the audience; however, the involvement is rarely, if ever, in the plot or the theme or the characters. The audience's morality has been shocked or the audience's privacy has been invaded. Such a shock causes resentment, breaks the frame of the proscenium, and in effect creates an underdistancing to the offending element in focus and an overdistancing to the play as a whole. One part of the play has indeed become a real life event to the audience, but the gimmick reaches the audience where it lives at the expense of the play as a whole. The main point of the play is often lost.

b) <u>Attempts to Lessen Distance In order to Affect Audience Behavior</u>.--As long as distance is maintained it is difficult, if not impossible, to break down audience predisposition and have a play affect an audience morally. That is, a play may move an audience because it plays upon its beliefs and emotions; the play may reach the emotions through empathy, or reach the intellect through giving assent to or dissent to previously held concepts. However, for the play actually to affect practical behavior would

require that the audience un-distance itself and consider
a play as an event, as a practical element in a chain of
cause and effect. Hence, the teaching play, the art object
that is a moral deterrent, is perhaps not possible. How-
ever, this area is certainly one in which much testing
can be profitably made. It seems that a play can support
an audience in previously held beliefs, it can stir up
emotions the audience has already felt, it can muster
these familiar feelings and sentiments in support of some
fictional stage character, purpose, or activity. However,
it is yet to be proven that the "lesson" from the fictitious
situation is ever learned or applied by an audience in its
practical life.

4. Distancing Devices vs. Theatrical Communication

It is the contention of this study that a director does
well to learn the language of movement, as well as the
language of words, so that he may communicate as completely
as possible to his audience without distancing devices.
The attempt to affect aesthetic or psychical distance by,
for example, breaking down physical distance is an effort
that directly opposes the predisposition of the audience.
The attempt may merely destroy the unified impression of
the play. If the play has a practical point to make per-
haps the point is better made in an after-the-play discussion
group, or in a lecture where the audience predisposition is
a practical one, unless, of course, the play is understood

by its audience from the beginning to be a dramatized lecture and not an object of art.

The suggestion for the director is two-fold: neither underdistancing nor overdistancing seem to succeed in closing the gap between pure aesthetic interest and practical, behavior-changing interest; the audience pre-disposition is against it. Changing practical behavior by an entertainment form has yet to be proven effective.

The second suggestion is that attempts to vary the distance by using inconsistencies in stage conventions usually only succeed in destroying the unity and flow of a production. Such attempts either alienate the audience or force the audience to make sudden adjustment in its way of viewing in order to maintain a uniformity of dis-tance. The conclusion remains that distancing tricks are no substitute for a solid foundation in communication by verbal and movement meaning within the usual aesthetic and psychical distances from an art object

B. The Problems of Expression Without Communication

Possibly in part because of the difficulty aesthetic distance presents in movement's affecting human moral behavior, while movement can affect empathic emotional response deeply, many artists have gone to an extreme, saying that pure expression, not communication at all, is the goal of art. Some artists in the theatre of the absurd
go so far as to deny the possibility of communication
even to the point of writing plays to communicate that
idea. Some try to maintain such a strict aesthetic dis-
tance that, not only is there no psychical content left
in their expression, but there is also little recognizable
aesthetic form. However, as has been discussed in Chapter
VII about expressive dance, usually the theatre wishes to
communicate the content of its expression more than it
wishes merely to express it.

1. Proposal: Expression Without Communication Impossible

This study would like to propose a view of the two
activities that suggests that there is no expression
without communication, and those who claim interest in pure
expression have an interest in a non-existent category.
Expression exists, but not apart from communication except
for purposes of analysis. Their relationship is not unlike
that of the two sides of a piece of paper. Each side
exists and can be categorized separately, but in experience
they cannot be separated without destroying both.

The above point of view is to some extent dependent on
the meaning of words, but this study is more concerned with
the facts of experience to which the words refer than to
the word play.

a) Test of Expression: Embodiment.--The most practical
use of the term "expression" seems to involve a process
whereby the artist embodies a feeling, emotion, idea, or

fact in some form that can be perceived by the senses. The
process involves a change of media; the change can be
illustrated better than defined. For example, a thought
is expressed as a painting, an emotion is expressed as a
gesture, or a concept is expressed as a building. When
an intangible idea or emotion is embodied in a tangible, or
at least perceivable, form, the idea or emotion can be said
to be expressed.

b) <u>Test of Embodiment: Communication</u>.--The test of
whether or not an emotion is actually embodied in a
stage movement seems to be for someone to be able to read
back out of the movement the emotion that is supposedly
expressed in it. The "reading" may be in terms of a felt
emotion, an empathic response, or an intellectual awareness
that the emotion is expressed. If the person expressing the
emotion is the only one who can so "read" the emotion
out of the movement, then the expression is communicated
but is extremely esoteric and subjective. If a large
number of people can "read" the emotion then the expression
is one generally understood by the culture. If everyone
who perceives the expression "reads" the emotion out of it,
either consciously or unconsciously, then the expression is
probably a universal embodiment of that emotion.

The contention of this study is that if an emotion is
truly embodied in a stage movement that is perceived by an
audience, the movement will communicate that emotion to
the audience. The audience may be small, even so small as

to include only the artist who created the embodiment, but the movement will communicate. If the movement does not communicate the emotion, not even to its creator, either the emotion is not being perceived or the emotion cannot be said to be embodied in the expression.

c) Expression and Communication: Two Parts of One Process.--Hence, if the above reasoning is accepted, the only basic difference between expression and communication is that expression is the first part of the process and communication is the second. The process may not be completed in some particular instance; in which case the most that can be said of the first part is that it is an attempt to express something, the success of which is still to be tested in communication.

2. The Alternatives: Designed Communication or Therapeutic Expression

The communication-expression distinction is of importance to the stage director for several reasons. First, what would the expression be that did not communicate, not even to its creator, what was supposedly expressed by its creator? This study would label it a catharsis for the artist, a by-product of the therapeutic use of the techniques of the theatre art. For the emotion would not actually be embodied in the so-called expression; the emotion would merely be "worked off" in the process of engaging in the use of art techniques. The by-product would not be an

expression of the emotion but a waste product from the process.

To be an art product the expression needs to communicate what the artist expected to embody. Sometimes an art product merely connotes whatever subjective associations each member of the audience has for the form and content of the art work. If this happens then communication still has not taken place, for communication is a process of conveying something from one mind to another. To have hit upon diverse associations by chance is not communication. For the theatre artist, at least, art should be no less than designed communication involving the conscious embodiment of an idea or feeling in a stage movement, embodied in such a way that the audience can generally read back from that movement the same idea or feeling the artist-director consciously embodied. To achieve this goal the artist-director should not be content until he has explored all the possibilities for meaning in movement and until he has learned to compose in its language. More often than not there are some meanings, overtones and undertones, that will be unique to the individual member of the audience or to the artist-director. But if the main core of meaning, along with many subtleties, is not communicated to the majority of his audience, the director has to some extent fallen short of his potential.

This study is not concerned with communication to the

small ingroup, or with therapeutic activity for the artist; nor is it concerned with communication by accident. There is no craft, no principle, nor any guidance possible for the unique and esoterically subjective; nor is there an audience. Creation of art has pattern, purpose, and control, and the extent to which this process is completed without undue loss of the artist's intended meaning along the way is the extent to which the creator is both craftsman and artist.

C.   The Problems of The Role of The Director:

Organizer, Interpreter, or Creator

The creative artist is the role which the play director must adopt if any of the control and responsibility for communication is to be assumed by him. The writer of a script provides a verbal framework for a production. The director takes this scenario and combines the talent and the bodies of other artists into a production. The work of art is the production in performance, not the script. One of the basic tenets of aesthetics is that an art work is complete. Nothing can be added to it or taken away from it without doing violence to its unity. A script is, at best, only the auditory portion of a play. It is not complete; if it were complete it would be an art work of literature and not a play script.

1. The Director's Total Responsibility for the Art Product

Again, if the above reasoning is appealing, the conclusion is that the director is the only possible controlling artist in the theatre. All others are what might be called contributing artists. The total art work, the production in front of the audience, is the responsibility of the director. When an artist has this responsibility he must also assume the freedoms that go with such creative duties. He must be able to shape, build, add, rearrange, emphasize, de-emphasize, eliminate, and distort anything that may be necessary in order that the finished art work be an integrated and communicating whole.

2. The Director's Total Responsibility to The Audience

Some authorities say that the director must be true to the playwright's intent. The director-artist should consider being "true to" the audience and to nothing else. "True to" the author's intent, the actor's intent, the producer's intent, or to the intent of any other contributing artist in the company may sometimes in practical ways produce a good play for the audience. But if that be so then the director is simply not the total artist he should be. He is really more an organizer, a traffic policeman, or a personnel director. Such a director would have little need for a creative language of movement.

D. Summary Conclusion: Movement Problems and

Directions For Solution

There are many problems that stand in the way of
providing movement that will have meaning in the director's
compositional context. Among them are aesthetic and
psychical distance, the audience's predisposition in coming
to the theatre, the foggy artist's reasoning that is con-
tent to communicate partially or merely to express, and the
convention among conservative theatre people that the
director's role is only that of interpreting the playwright's
script. The director himself may err by being esoteric, by
mismatching metaphors, or simply by laboring unknowingly
against or to recreate what has been known and practiced
for years. He may even fail to communicate at all through
having no basis in tradition for his experimentation.

To start solving the problems, the director ought first to
become familiar with the past,the ways the directors,
cheoregraphers, pantomimists, psychologists, and film-
makers before him have found efficacious. He ought then to
experiment in the present with these principles and techniques
to develop a style of his own best suited to what he would
like to say. Perhaps eventually, in the future, some of the
more scientific minded of the directors can do the others a
great service by subjecting each principle slowly and pains-
takingly to controlled tests. In that way, they may discover

what ingredients, or combination of ingredients, in each
compound of movement actually is producing the desired
meaning.

Certainly the most challenging idea for the director
is not only to discover present meanings but to create his
own traditions, conventions, and unique expressions on the
stage. Not the least of these creations could be a new
language of movement. And in creating movement meaning he
should remember that the great directors of this or any
era were not held back by what others thought they should
do, or not do, nor on the other hand, were they content
unless the majority of their audience was swayed simultaneous-
ly with their intent. Nor need any other director of today
be seriously hindered in creating meaning if he has the
humility to learn what his fellow artists have discovered
before him and the courage to define his role anyway he may
choose.
