## ABSTRACT

**Measurement and Analysis of Temperature and Pressure in High Altitude Air Shipments**

By

Joseph Stallings

This study was performed to measure temperature and pressure conditions observed by standard packages in the FedEx "Next Day Air" network and the environmental conditions of Passenger Aircrafts. To measure the single parcel environment, two destinations known to be served by non pressurized feeder and pressurized aircrafts in the United States, San Luis Obispo, California and Twin Falls, Idaho, were used to represent higher altitude paths. Test packages (12 x 12 x 12 in) containing one MadgeTech PRTemp110 recorder were shipped Priority Overnight by FedEx to each destination from East Lansing, Michigan. For six weeks, two test packages were shipped to each destination. To measure the Passenger aircraft environment, test packages (5 ⅝ × 4 ⅜ × 2 ⅜ in) were both carried in the passenger cabin and checked with luggage. Results show temperature ranges, pressure drop rates, and maximum altitudes observed in the FedEx environment and in commercial passenger flights. This study compares these results with the ASTM D6635 test procedure with respect to suggested test pressure, pressure change rate, temperature, and test duration.

To my parents and siblings who inspire me to achieve my goals

To Veronica with love

## ACKNOWLEDGMENTS

I wish to express sincere appreciation to my major professor Dr. S. Paul Singh for his invaluable guidance and assistance. I would also like to thank other members of my graduate committee, Dr. Gary Burgess and Dr. Kirk Dolan for their support.

I also would thank Dr. Jay Singh and Tammy Scheer for the assistance provided during the completion of this study.

My thanks are also due to April Meersdom, Linda Estill, and Colleen Wager for all of their support.

Finally, I would like to express my gratitude to my wonderful family and friends who have loved me throughout all the adventures in life.

# 1.0 INTRODUCTION

Packaged goods are often moved to and from all populated areas. The continuous increase of shipped packaged goods led to more efficient methods and models of transportation. To decrease the costs and time associated with package distribution, many systems consist of complex networks and throughout these distribution systems, packaged goods are subjected to a variety of physical and environmental hazards. Today, package carrier companies utilize all possible modes of transportation and packaging must be designed to protect goods throughout all hazards associated. The air express industry plays an important role in package distribution and is expected to grow at a rate of 6.4% per year (Pettus, 2006).

Frederick Smith established Federal Express in 1973 in Little Rock, Arkansas with the desire to provide delivery services through an integrated and non linear air and ground distribution system. In that same year, operations were relocated to Memphis International Airport in Tennessee. At that time, Federal Express owned a fleet of 14 airplanes, employed nearly 400 workers, and provided both overnight and two-day package and envelope delivery services. Federal Express has since evolved to FedEx Express under the FedEx Corporation. Today, FedEx Express is the world's largest express transportation company. Using global air-and-ground networks, FedEx Express is able to provide delivery services to all address in the United States and to more than 220 countries and territories. Using global air-and-ground networks, FedEx Express

delivers approximately 3.4 million packages daily. FedEx Express' 671 aircrafts serve more than 375 airports around the world (FedEx, 2007).

In the continental United States, FedEx Express provides a range of shipping services for delivery of small packages up to 150 pounds and delivery is guaranteed in one to three business days. FedEx Express' most popular service in the United States is the "FedEx Priority Overnight." In this service, packages or envelopes can be shipped and delivered by 10:30 a.m. on the next business day. To achieve this, FedEx Express uses the "Hub and Spoke" system to deliver packages. FedEx Express' 664 local operating Facilities, located all around the United States, serve as the "spokes". Of the 5 air express hubs, the FedEx Express Super Hub is strategically located in Memphis, Tennessee. Other continual Unites States hubs are located in Fort Worth, Texas, Indianapolis, Indiana, Newark, New Jersey, and Oakland, California (FedEx, 2007). Figure 1 shows the movement of a typical package thought this delivery network. As packages are moved though this network of locations and though a variety of transportation vehicles, packages are subjected to a series of hazards such as drops, impacts, crushing forces, and climatic conditions before it reaches the consumer.

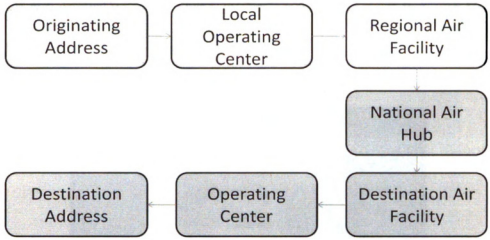

**Figure 1: Typical Package Movement Though FedEx Express**

If the package's destination is not immediately served by a major airport or is located in a remote area, it is introduced into a "feeder" aircraft network. The cargo area is not pressurized in many feeder aircrafts and when necessary, these aircraft will fly at altitudes that will affect the environmental conditions in the cargo area. When exposed to these conditions, products and/or packages may be unfavorably affected by the changes in pressure and temperature. Figures 2, 3, 4, and 5 are examples of undesirable effects on packaged products after pressure change. In figures 2 and 3, pressure change caused undesirable effects to the foil seal of Nesquick Chocolate Flavor packages. The package's appearance is compromised if foil's budge forces the container's lid off and if the seal failed, the product is exposed to the surrounding environment. Figure 4 shows a similar effect on Pringles cans sold on a retail shelf. Figure 5 shows the failed seal of a bag of potato chips due to pressure change. Figures 6 and 7 are

examples of the feeder aircrafts used by FedEx Express. Of the 296 feeder aircrafts in FedEx Express' fleet, 27 are ATR 42s and 242 are Cessna 208Bs.

**Figure 7: FedEx Cessna 208B**

On May 11, 1996, the ValuJet Flight 592 crashed while en route from Miami International Airport in Miami, Florida to what is now known as Hartsfield-Jackson Atlanta International Airport in Atlanta, Georgia. Within 10 minutes of takeoff, the pilot and first officer asked air traffic control for a return to Miami due to smoke in the cockpit and cabin. The McDonnell Douglas DC-9 shattered on

impact killing the 5 crew members and 105 passengers onboard. It was determined that the accident was caused by a fire produced by expired chemical oxygen generators placed in the cargo of the plane. As a hazardous material, the generators should not have been shipped in this way. Also, the firing pins for the generators were not properly protected with plastic sleeves and that the canisters were not empty as declared on the cargo manifest. The National Transportation Safety Board placed fault on SabreTech for illegally transporting dangerous materials aboard a commercial aircraft, improperly labeling them, and not providing safety equipment to ship them, ValuJet for not properly supervising SabreTech and ensuring compliance, and the Federal Aviation Administration for not properly supervising ValuJet and not requiring active fire suppression equipment in this cargo compartment (NTSB, 1997). This incident led the FAA to increase their focus on the shipment of dangerous goods on aircrafts. The challenge involved participation between all parties including shippers and carriers as well as an understanding of the environment and the dangers associated.

In 2001, the United Parcel Service presented a study to the American Society of Testing and Materials describing the conditions that packages experience in the single parcel shipping environment. The study resulted in the following key observations as described in ASTM D6653-01 (ASTM D6653-01, 2006):

1. Cargo air jets are typically pressurized to about 75kPa, which is normal atmospheric pressure at an altitude of 2438m (8000ft). Temperature is maintained at approximately 20–23°C (68–74°F)
2. Packages transported on the ground may experience altitudes as high as 3658m (12000ft) when shipped over certain mountain passes, especially in Colorado. Temperature extremes range from -15 to 30°C (5–86°F) with average temperatures ranging from -4 to 18°C (25–64°F)
3. Non-pressurized 'feeder aircraft' typically fly at approximately 3963–4877m (13000– 16000ft). The highest recorded altitude in a non-pressurized feeder aircraft was 6017m (19740 ft). Temperatures ranged from approximately - 4 to 24°C (25–75°F).

ASTM D6653, Standard Test Methods for High Altitude on Packaging Systems by Vacuum Method, evaluates the effect of pressure differential when packaged products are transported by feeder aircrafts over high mountain passes. This test standard suggests the following:

1. Conditioning and Testing
    a. Conditioned and Tested at 42 ± 3.6 °F (5.6 ± 2 °C)
        i. Pressure equivalent to 16,000 ft (4,877 m) ± 5%
    b. Conditioned and Tested at 73.4 ± 3.6 °F (23 ± 2 °C)
        i. Pressure equivalent to 14,000 ft (4,267 m) ± 5%
2. Pressure Rise and Fall
    a. 1,000 ft every 30-60 sec
        i. 13.33 - 33.33 ft/s

3. Vacuum Time
    a. 60 minutes

The ASTM D6653 standard calls for test specimen to be conditioned at the temperature given in the first case for a minimum of 24 hours prior to testing. The temperature given in the second case is recommended if the first condition is not possible. The standard calls for the test specimen to be tested at the pressure equivalent that corresponds to the conditioning condition.

This study had the following objectives:

1. Measure and analyze the environmental conditions in the FedEx Express' "Priority Overnight" network.
2. Compare ASTM D6635 test procedure to environmental flight data from "feeder" and "pressurized" aircraft with respect to pressure, temperature, duration, and rise and fall time
3. Measure the environmental conditions of Passenger Aircrafts

## 2.0 EXPERIMTAL DESIGN

The goal of this study was to evaluate the single parcel environment of the "Priority Overnight" service used by FedEx Express and commercial aircrafts. To accomplish the goals of this study, this experiment was designed to collect pressure and temperature data from both environments. The data collected describes the environment packaged products may experience. The instrumentation and packaging used will be described in this chapter

### 2.1 Test Instrumentation

Five MadgeTech PRTemp110 pressure and temperature recorders were acquired for this study. These devices are available from MadgeTech and are commonly used to collect environmental data in many other situations. The recorders can measure both temperature and pressure with respect to time. The semiconductor temperature sensor can record temperatures from -40 to 80 $°C$ with a calibrated accuracy of ± 0.5 ℃ and a temperature resolution of 0.1 ℃. The semiconductor (strain gauge) pressure sensor can record pressure data from 0 to 30 psia with a calibrated accuracy of ± 0.2% with a resolution of 0.002 psi. The PRTemp110 is able record 16,383 data points in each of its two channels in non-volatile solid state memory at rates from 2 seconds to 12 hours. The PRTemp110's dimensions are 1.7" x 2.3" x 0.9" and it weighs 1 oz. Each

PRTemp110 is powered by a disposable 3.6 volt lithium battery (MadgeTech). Figure 8 is an example of the recorder used in this study.

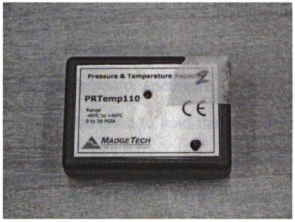

**Figure 8: Madge Tech PRTemp110 Pressure and Temperature Recorder**

The MadgeTech Data Recorder Software was used to set up and download data from PRTemp 110 recorders. The software automatically calculates and stores calibration parameters and was also used to display and analyze the recorded data.

### 2.2 Test Package System

Test packages were used along with the Madge Tech PRTemp 110 recorders to measure the pressure and temperature events the packages were exposed to in the FedEx Express and passenger aircraft environments.

When shipped through the FedEx Express network, the recorders were housed in the geometric center of test packages made from double wall corrugated board and paperboard. The test packages consisted of six components: one PRTemp 110, one paperboard enclosure, three double wall corrugated internal inserts, and the outer double wall corrugated case. Figure 9 shows the recorder in the paperboard enclosure. The three double wall corrugated internal inserts were designed to hold the recorder/enclosure and to give additional internal bracing to provide strength. A square inch was cut into the top insert directly above the PRTemp 110 to provide a window for the pressure and temperature sensor. The outer double wall corrugated case was a stapled regular slotted container. Figure 10 and 11 show the test package and test package setup. The size and weight of this test package were as follows:

Size:

PRTemp 110 Recorder: 1.7 x 2.3 x 0.9 inches

Test Package: 12 x 12 x 12 inches

Weight:

PRTemp 110 Recorder: 1 oz

Test Package with Recorder: 50 oz

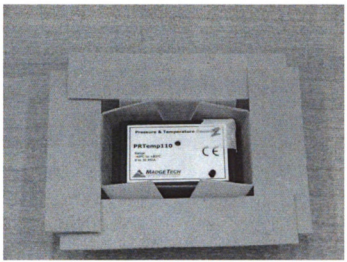

**Figure 9: PRTemp 110 Recorder in Paperboard Enclosure**

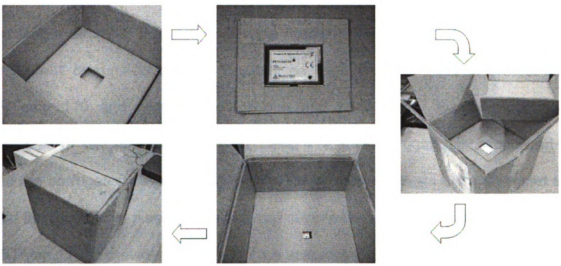

**Figure 10: Single Parcel Test Package Setup**

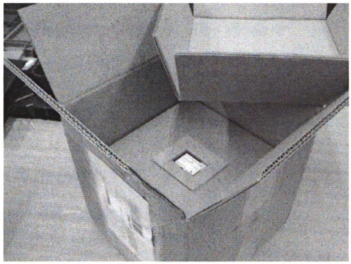

**Figure 11: Single Parcel Test Package Internal Bracing**

When carried into the passenger cabin or checked with luggage on passenger aircrafts, the recorders were housed in a test packages made from single wall corrugated board. The test package was designed to protect the PRTemp 110 and provide convenience and portability. The test package consisted of six components: one PRTemp 110, four corrugated internal inserts, and the corrugated case. The four corrugated internal inserts were designed to hold the recorder in place. A square was cut into the top insert directly above the PRTemp 110 to provide a window for the pressure and temperature sensor. The corrugated case was a one piece tuck in top. Figure 12, 13, and 14 show the passenger aircraft test package. The size and weight of this test package were as follows:

Size:

PRTemp 110 Recorder: 1.7 x 2.3 x 0.9 inches

Test Package: 6 x 4.5 x 2.375 inches

Weight:

PRTemp 110 Recorder: 1 oz

Test Package with Recorder: 4.2 oz

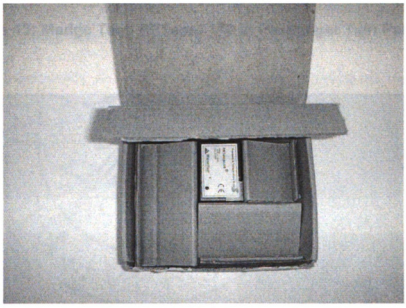

**Figure 12: Test Package with Corrugated Inserts**

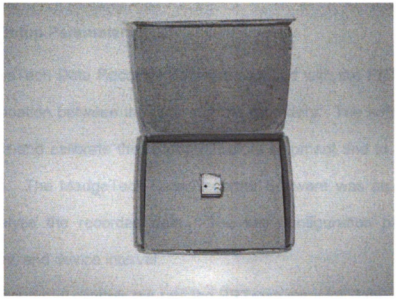

**Figure 13: Madge Tech PRTemp 110 in Passenger Test Package**

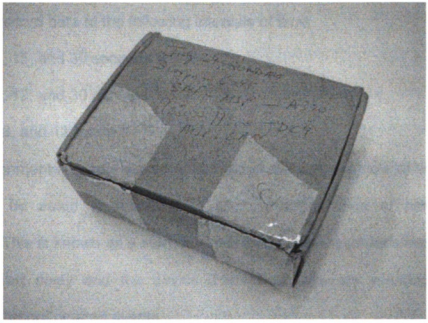

**Figure 14: Passenger Test Package**

## 2.3 Instrument Setup Parameters

The MadgeTech Data Recorder Software supplied with the PRTemp 110 permits communication between the user and the recorders. The software was used to configure and calibrate the recorders before shipment and to download data for analysis. The MadgeTech Data Recorder Software was also used to display and analyze the recorded data. The key configuration parameters include start delay, and device interval.

The device interval controls the rate the PRTemp samples data. A smaller interval is necessary to measure and describe pressure rise and fall rates. A larger interval is necessary to measure longer trips. The PRTemp 110 can be configured to record data at the following intervals of time:

2, 5, 10, 15, and 30 seconds

1, 5, 10, 15, and 30 minutes

1, 2, 4, 8, and 12 hours

If environmental events are expected within a known window of time, the recorder can be setup to record data after a given value of time after configuration. This is known as a start delayed. Since each recorder's memory is limited, the start delay and the device interval settings are valuable setup parameters to record desired events.

The PRTemp 110 recorders are powered by non-rechargeable 3.6 volt lithium batteries. To function correctly, the battery must hold a sufficient charge. A fully charged battery is advertized to function for 10 years if set to continuously record data every 15 minutes. However, at faster sampling rates, the battery

may need to be replaced after nearly a month of use. Replacement batteries were acquired and used when needed.

## 2.4 Instrument Configuration and Calibration

The recorders were calibrated by Madge Tech before delivered for this experiment. Recalibration, by Madge Tech, is suggested yearly. To ensure the recorders functioned properly, simulated laboratory pressure testers were performed. The recorders were placed alone and in test packages into a pressure chamber to confirm the calibration parameters. This test was performed at the Michigan State University School of Packaging laboratory. Figure 15 and Figure 16 show the pressure and temperature data recorded. Figure 17 shows two PRTemp 110 recorders in the pressure chamber at Michigan State University. A test was performed to determine the test package's effect on the recorded data. This test was also performed at the Michigan State University School of Packaging laboratory. Figure 18 shows a test package inside a vacuum chamber. Four PRTemp 110 recorders were placed inside a vacuum chamber. Two recorders were placed inside a test package. The recorders collected pressure and temperature data every minute as the pressure inside the chamber changed. Table 1 shows the pressure and temperature data collected. This data shows the temperature inside the test package is about 1.21 ℃ warmer than the temperature outside the package. The pressure data

collected by the recorders in the test packages was consistent with the pressure date collected by the recorders outside the test packages.

| | | | | | 1.21 |

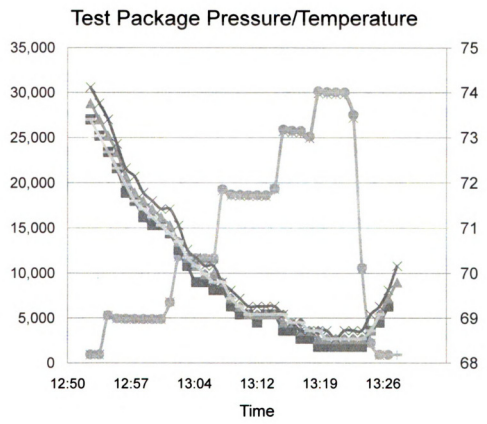

**Figure 19: Average Temperature Difference Recorded**

## 2.5 DATA COLLECTION

The intent of this study was to measure and analyze the pressure and temperature observed in the single parcel environment and the pressure and temperatures measured on passenger aircrafts when carried on and checked with luggage. This data was to be compared with the ASTM D6653 test procedure.

To measure the single parcel environment, two destinations known to be served by non pressurized feeder aircrafts were identified to represent high altitude paths. The two destinations were San Luis Obispo, California and Twin Falls, Idaho. The test packages were sent from East Lansing, Michigan. Multiple test packages were shipped to each destination to increase the reliability of the collected data and recorders were alternated *though* different destinations. For six weeks, two recorders were shipped to each destination. Test packages were shipped at the beginning of each week to ensure they were returned before the weekend.

The test packages were shipped Priority Overnight by FedEx Express. Test packages were picked up by FedEx Express from the School of Packaging at Michigan State University and loaded into a delivery vehicle. The packages were taken to the local FedEx operating station and consolidated with other packages intended for delivery. Figures 20 and 21 shows the path test packages were moved though to each destination.

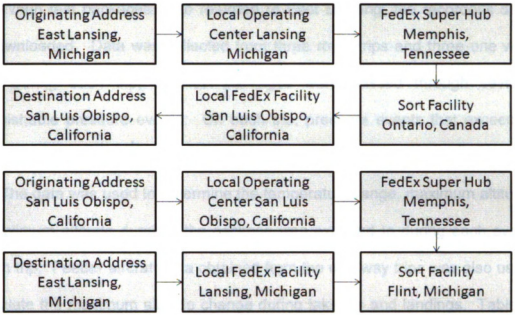

**Figure 20: Flow Path East Lansing, Michigan/San Luis Obispo, California**

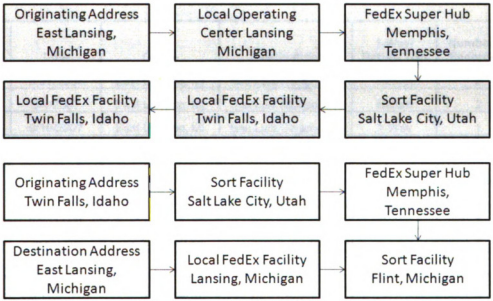

**Figure 21: Flow Path East Lansing, Michigan/Twin Falls, Idaho**

When test packages were returned to East Lansing, the recorder's data was downloaded. Data was collected from three roundtrips and three one way trips. During each trip, the test packages were passed through several distinguishable pressure events. On each trip, pressure events that exceed a pressure equivalent altitude of 8,000 ft were considered to be a feeder aircraft flight. The data was used to determine the temperature range, maximum altitude and maximum altitude duration the package was exposed to during each event for each trip. Feeder aircraft data obtained from the one way trips was also used to calculate the maximum altitude change during takeoffs and landings. Table 2 shows this test history.

**Table 2: Summary of FedEx Shipments**

| Shipment | Date | Origin | Destination | 1-Way/ Return Trip | Number of Recorders |
|---|---|---|---|---|---|
| 1 | 8/27/2007 | East Lansing, MI | San Luis Obispo, CA | Return | 2 |
| 2 | 9/4/2007 | East Lansing, MI | San Luis Obispo, CA | Return | 2 |
| 3 | 9/10/2007 | East Lansing, MI | San Luis Obispo, CA | 1-Way | 1 |
| 4 | 9/17/2007 | East Lansing, MI | San Luis Obispo, CA | 1-Way | 2 |
| 5 | 9/24/2007 | East Lansing, MI | San Luis Obispo, CA | Return | 2 |
| 6 | 10/1/2007 | East Lansing, MI | San Luis Obispo, CA | 1-Way | 2 |
| 7 | 8/27/2007 | East Lansing, MI | Twin Falls, ID | Return | 2 |
| 8 | 9/4/2007 | East Lansing, MI | Twin Falls, ID | Return | 2 |
| 9 | 9/10/2007 | East Lansing, MI | Twin Falls, ID | 1-Way | 1 |
| 10 | 9/17/2007 | East Lansing, MI | Twin Falls, ID | 1-Way | 2 |
| 11 | 9/24/2007 | East Lansing, MI | Twin Falls, ID | Return | 2 |
| 12 | 10/1/2007 | East Lansing, MI | Twin Falls, ID | 1-Way | 2 |

Data was also collected to measure the environment of commercial aircrafts. In July, 2007, the test package designed for passenger aircrafts was carried on two connecting flights, Michigan to Minneapolis and Minneapolis to California, and on return, checked with luggage. (Boeing DC-9 and Airbus A320) In August, 2007, the test package was checked on a one way regional Jet from Michigan to Arkansas. Later in August, 2007, the test package was checked to measure the environment of connecting flights in a one way international trip from Michigan to Bangladesh. Table 2 shows this test history.

**Table 3: Summary of Passenger Aircrafts Shipments**

| Shipment | Date | Origin | Destination | Via |
|---|---|---|---|---|
| 1 | 7/27/2007 | East Lansing, MI | Sacramento, CA | Minneapolis, MS |
| 2 | 8/1/2007 | East Lansing, MI | AR | None |
| 3 | 8/6/2007 | East Lansing, MI | Bangkok, Thailand | Detroit, MI; Tokyo, Japan |

## 3.0 DATA AND RESULTS

The data acquired from the PRTemp 110 recorders was downloaded using the MadgeTech Data Recorder Software. The MadgeTech Data Recorder Software was used to convert the pressure data into its altitude equivalent using the U.S. Standard Atmosphere model. The data was exported into spreadsheets for analysis. Table 4 shows altitude and pressure conversion data.

**Table 4: Altitude/ Pressure Table**

| Altitude, ft | Altitude, m | Pressure, inHg | Pressure, psi |
|---|---|---|---|
| 0.00 | 9.12 | 29.92 | 14.69 |
| 1,000.00 | 8.79 | 28.85 | 14.17 |
| 5,000.00 | 7.59 | 24.89 | 12.22 |
| 8,000.00 | 6.78 | 22.24 | 10.92 |
| 10,000.00 | 6.27 | 20.58 | 10.10 |
| 12,000.00 | 5.81 | 19.05 | 9.35 |
| 14,000.00 | 5.36 | 17.57 | 8.63 |
| 16,000.00 | 4.94 | 16.21 | 7.96 |
| 18,000.00 | 4.55 | 14.94 | 7.34 |
| 20,000.00 | 4.19 | 13.76 | 6.76 |
| 26,000.00 | 3.24 | 10.63 | 5.22 |
| 30,000.00 | 2.71 | 8.88 | 4.36 |
| 40,000.00 | 1.69 | 5.54 | 2.72 |
| 50,000.00 | 1.05 | 3.44 | 1.69 |

Tables 5 and 6 show the maximum pressure equivalent measured for each pressure event in all one way and round trip shipment as well as the time it was observed within 600 ft in the FedEx Express environment. Table 6 and 7 show the maximum and minimum temperature measured for each pressure event in all one way and round trip shipment in the FedEx Express environment.

Table 6 also shows the greatest altitude change in an observed five second interval during the aircraft's take off and landing for the event with the greatest altitude. These events are assumed to represent a FedEx Express feeder aircraft. Figure 21 shows graphed round trip pressure data recorded on the August 27$^{th}$ trip. The altitude peaks greater than 8,000 feet represent a feeder aircraft and are identified.

**Table 5: Summary of Altitude Round Trip**

| | Trip Number | Sample Rate, seconds | Event 1 | | Event 2 | | Event 3 | | Event 4 | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | Maximum Altitude, feet | Duration, minutes | Maximum Altitude, feet | Duration, minutes | Maximum Altitude, feet | Duration, minutes | Maximum Altitude, feet | Duration, minutes |

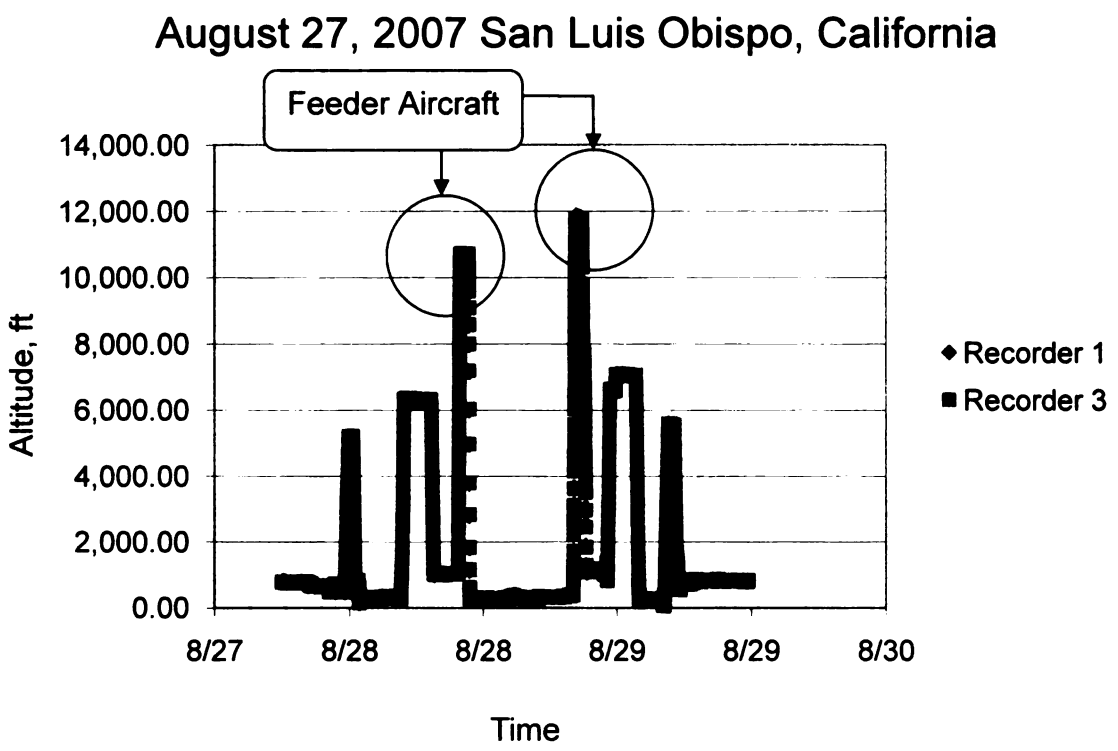

**Figure 21: San Luis Obispo Round Trip Altitude Data, August 27**

Table 9 shows the maximum pressure equivalent altitude, maximum temperature, and minimum temperature measured for each passenger flight trip studied.

**Table 9: Summary of Passenger Flights**

| Date | Description | Sample Rate | Cabin/ Checked | Maximum Altitude, feet | Maximum Temperature, °F | Minimum Temperature, °F |
|---|---|---|---|---|---|---|
| 7/27/2007 | Michigan -Minnesoda -California | 5 minutes | Checked | 7,171 | 78.80 | 57.00 |
| 7/29/2007 | California - Minnisoda - Michigan | 5 minutes | Cabin | 7,372 | 78.40 | 71.90 |
| 8/1/2007 | Michigan - Arkansaw | 10 seconds | Checked | 4,460 | 78.80 | 77.00 |
| 8/6/2007 | Michigan - Michigan | 30 seconds | Checked | 6,346 | 76.80 | 72.90 |
| - | Michigan - Tokyo | 30 seconds | Checked | 5,845 | 76.60 | 63.10 |
| - | Tokyo - Bangladesh | 30 seconds | Checked | 7,012 | 72.70 | 69.80 |

## 4.0 CONCLUSIONS

The study concludes the following:

1. The highest pressure equivalent altitude observed in the FedEx environment for six round trips and five one way trips from East Lansing, Michigan to San Luis Obispo, California was 11,973 ft (3,649 m) with a temperature of 70.5 – 80.4 ℉ (21.4 – 26.9 ℃).

2. The highest pressure equivalent altitude observed in the FedEx environment for six round trip and five one way trip from East Lansing, Michigan to Twin Falls, Idaho was 17,453 ft (5,320 m) with a temperature of 60.3 – 75 ℉ (15.7 – 23.9 ℃).

3. The existing ASTM D6653 test procedure, Standard Test Methods for Determining the Effects of High Altitude on Packaging Systems by Vacuum Method, suggests a pressure equivalent to 14,000 ft (4,267 m) when conditioned and tested at 73.4 ± 3.6 ℉ (23 ± 2 ℃), or 16,000 ft (4,877 m) when conditioned and tested at 42 ± 3.6 ℉ (5.6 ± 2 ℃). The highest pressure equivalent altitude observed in the FedEx environment (17,453 ft, 60.3 – 75 ℉) is more strenuous.

4. The largest feeder flight duration was approximately 46 minutes. The existing ASTM D6653 test procedure suggests a vacuum be maintained for 60 minutes. The maximum pressure equivalent altitude measured during this shipment was 10,706 ft.

5. The existing ASTM D6653 test procedure, Standard Test Methods for Determining the Effects of High Altitude on Packaging Systems by Vacuum Method, suggests that test chamber vacuum should be raised at a rate of 306 m (1,000 ft) every 30 – 60 s (13.33 – 33.33 $\frac{ft}{s}$). All maximum rise and fall changes observed in the FedEx environment fell within this range. This is consistent with known aviation practices and limitations.

6. The pressure measured in the cabin of passenger aircrafts was not significantly different than the pressure measured in the cargo hold.

## 4.1 Recommendations for High Altitude Package Effects Test Procedure

The data produced in this study suggests the testing requirements in ASTM D6653 do not completely reflect the single parcel feeder aircraft environment. Assurance levels, level of test intensity based on its probability of occurring in a typical distribution cycle, should be suggested in the ASTM D6653 standard for determining the effects of pressure change of packaging systems at higher altitudes.

- Assurance Level 1 Conditioning and Testing
    - Conditioned and Tested at 73.4 ± 3.6 °F (23 ± 2 °C)
        - Pressure equivalent to 18,000 ft (4,267 m) ± 5%
- Assurance Level 2 Conditioning and Testing
    - Conditioned and Tested at 73.4 ± 3.6 °F (23 ± 2 °C)
        - Pressure equivalent to 14,000 ft (4,267 m) ± 5%
- Pressure Rise and Fall
    - 1,000 ft every 30-60 sec
        - 13.33 - 33.33 ft/s
- Vacuum Time
    - 60 minutes

The conditioning and testing options suggested in ASTM D6653 - 01, conditioned and tested at 42 ± 3.6 °F (5.6 ± 2 °C) at a pressure equivalent to 16,000 ft (4,877

m) ± 5% and conditioned and tested at 73.4 ± 3.6 °F (23 ± 2 °C) at a pressure equivalent to 14,000 ft (4,267 m) ± 5% does not correctly reflect temperature and pressure correlation. The ASTM D6653 standard should be adjusted to account for this.

# Measurement and Analysis of Temperature and Pressure in High Altitude Air Shipments

VOLUME II

By

Joseph Stallings

A THESIS

Submitted to
Michigan State University
in partial fulfillment of the requirements
for the degree of

MASTER OF SCIENCE

Packaging

2009

## APPENDIX B

### One Way Flight Data

East Lansing, MI to San Luis Obispo, CA One Way 1a

| Time | Event 1 | | Event 2 | | Event 3 | |
|---|---|---|---|---|---|---|
