THESIS

TWO YEARS' RESULTS ON PRODUCTION OF EARLY  
SPRING LAMBS.

1. Influence of Top Crosses of Different Breeds on  
Common Ewes.
2. Comparison of Dark-Faced and White-Faced Ewes.
3. Effect of Condition of Ewes at Breeding Season.
4. Effect of Driving Ewes Before Turning in of Rams.

THESIS

2

THE INFLUENCE OF TOP CROSSES OF DIFFERENT BREEDS  
ON COMMON EWES IN THE PRODUCTION OF  
MARKET LAMBS

by

C. A. Willson

Tennessee has been one of the foremost states in early spring lamb production, and offers an excellent opportunity for the expansion of this industry. The method that has been effectively employed by spring lamb producers in this State is to purchase common ewes from the states lying to the south and use one of the black-faced Down breeds for the top cross. Many problems have <sup>arisen</sup> in this industry which will be studied in an experimental way at the Middle Tennessee Experiment Station. There has been much debate among the producers, as to which of the black-faced Down breeds is most suitable for use as a top cross on common ewes in early spring lamb production. The present bulletin is a preliminary report on the use of Southdown, Shropshire, Hampshire and Oxford Down rams on common ewes. Data are also given on the effect of driving ewes before turning rams in at the breeding season, number of lambs of each sex produced, average birth weight of lambs of each sex, and conditions affecting the production of twin or single lambs.

PART I. 1920-21.

On July 26, 1920, 110 common ewes with unbroken months were purchased for the experiment. Most of the ewes had white faces, the remainder had black faces, but did not show striking breed

NOTE: The experiments were conducted under the immediate supervision of Mr. C. M. Hume, Acting Superintendent of the Middle Tennessee Experiment Station at Columbia.

characteristics except in a few cases. After the purchase of the flock by the Experiment Station, they were on August 13, 1920 divided into four equal flocks, weighed on large platform scales by groups, and labeled, then individual weights were obtained. The group weights were as follows:

Group I.	28 ewes, 2940 lbs.
" II.	28 ewes, 2940 Lbs.
" III.	27 ewes, 2845 lbs.
" IV.	27 ewes, 2845 lbs.

Data were collected in each case with regard to the condition of flesh, weight, color, health, whether the ewe had a long tail, whether bare on belly, and the approximate amount of breeding, if any.

In addition to the above, on August 14 the four flocks were brought in and each flock divided into halves. One-half was turned into one common flock and given a drive of 17 miles on the highway. Upon returning from the drive in the late afternoon, they were sorted out and turned back to their respective flocks. The rams were then turned in with the respective flocks.

Below is a list, by group and number, of the sheep that were taken on the 17 mile drive.

Sheep taken on 17 mile drive August 14, 1920.

The reason for taking one-half of each flock on a long drive before turning the rams with them was to test the theory existing for many years among Tennessee sheepmen, that if ewes are given a long drive before the ram is turned with them they will breed much earlier. The theory is that a long drive has the same effect on the ewes as flushing.

Fig. 2. Ewes used in experiment work. Picture taken August 6, 1921.

### Breeds Used in Top Crossing

The groups were headed by rams of four breeds, Group I, headed by a Southdown ram; Group II, headed by a Shropshire ram; Group III, headed by a Hampshire ram; and Group IV, headed by an Oxford Down ram. These breeds were selected for three reasons: (1) They represent those commonly used in spring lamb production in Tennessee; (2) there is a gradation in size from the Southdown to the Oxford Down; (3) and they were all of the black-faced breeds. Each ram used was strong, vigorous, and thoroughly typical of the breed. On August 13, the Southdown ram was described as 140 pounds in weight, three years of age, and in good condition; the Shropshire ram 149 pounds in weight, one year old, and in good condition; the Hampshire ram 168 pounds in weight, one year old and in thin condition. On October 28, the Shropshire ram died from an unknown cause, and immediately a two-year-old prize winning ram was purchased from a reputable breeder to take his place.

### Handling of the Flock During the Fall and Winter

Each flock was kept in a separate enclosure, the fences of which had been carefully examined to see that there were no openings where sheep of one flock could get through and become mixed with another flock. Each flock was changed to a different pasture every two weeks during the breeding season, usually to a fresh pasture. Where this could not be done, the flocks were rotated on their respective pastures. This was done in order that the conditions for the various flocks should be as nearly alike as possible. On October 15 all rams were taken away from their flocks for five days, and on October 21 the Hampshire ram was put with the flock that had been headed by the Southdown ram. On October 28

the Shropshire ram referred to above was purchased and put with the flock which had been headed by the Oxford ram. The Oxford ram was in the barn from October 14 to November 7 on account of foot-rot, and was than put with the flock that had been headed by the Shropshire ram. The Southdown ram had also experienced the same difficulty, and was not put with the flock that had been headed by the Hampshire ram until November 10. All rams continued with the flocks as above outlined until December 15. The reason for the change of rams was that there is always a possibility of a ram being sterile, and the change of rams to the various flocks doubled the chances of each flock of ewes being safely bred.

The weights of the fleeces of wool of the above rams on May 19, 1921, were as follows:

- Southdown ram, 8 pounds
- Shropshire ram, 12 pounds
- Hampshire ram, 11 pounds

The Oxford ram died during the winter, having been injured in fighting with the Hampshire ram.

After the rams were removed from the flocks on December 15, all flocks were turned into one common flock and grazed throughout the winter months on crimson clover rye. ~~During the winter months~~ They were in the barn only two days during the winter, and were fed hay and grain for only four feedings. During the spring months, the ewes lambed on crimson clover and rye fields and on crimson and red clover fields, and were continued on pasture of this character until the lambs were sold. The lambs or ewes were not given grain except for the four feeds mentioned. The flocks

during the breeding season were salted and counted twice each week, as was the common flock throughout the winter months. They had access to water at all times.

#### Descriptions of Ewes.

Tables 1, 2, 3 and 4 give weights and descriptions of individual ewes of each group as taken on August 13, 1920; and a column is added which gives weights of each fleece on May 19, 1921. The ages as given for the older ewes were estimated according to the appearance of the teeth. They are not exact for the older ages, but it was noted that when ewes were culled because of broken months on May 27 and July 1, 1921, in each instance they had been rated in the fall as being of seven or eight years of age.

In order to test the fairness of the division of the flock into the four smaller flocks, Table 5 has been prepared, being a summary of Tables 1, 2, 3 and 4.

Of the 110 ewes purchased and used in the experiment, there were, according to age, 6 yearlings, 14 two-year-olds, 12 three-year-olds, 27 four-year-olds, 23 five-year-olds, 16 six-year-olds, 6 seven-year-olds, and 6 eight-year-olds.

It will be noted that there was little variation in the average age of each group; also but little variation in each one of the other respective descriptions of the ewes of the different groups. The average age of Group I was 4.89 years; of Group II 3.96 years; of Group III, 4.62 years; of Group V, 3.92 years, and the average weights were as follows: Group I, 100.07 lbs; Group II, 101.42 lbs; Group III, 100.77 lbs, and Group V, 97.88 lbs. Other characteristics of each group were equally well balanced.

Considering the fact that 20 of the 110 ewes were classed as "thin" on August 13 and also that 7 died of Hemorrhagic Septicaemia during January, February, and March, the losses were not unusual. The number lost out of each group was as follows: Group I, 5 ewes; Group II, 3 ewes; Group III, 4 ewes; and Group V, 3 ewes. Of the ewes lost, one was classed in the fall as a yearling, 2 were classed as three-year-olds, 7 as four-year-olds, and 4 as six-year-olds; or 16.65 per cent of the yearlings, none of the two-year-olds, 16.65 per cent of the three-year-olds, 25.9 per cent of the four-year-olds, 43.6 percent of the six-year-olds, and none of the five-seven- and eight-year-olds. Twenty-five percent of those classed as thin in the fall died; 19.5 per cent of those classed as fair, and but 5.6 per cent of those classed as in good condition.

## Management of Ewes and Lambs During Lambing Season

The ewes began to lamb January 21 on open fields of crimson clover and rye, and red clover and crimson clover. The flocks were under observation three or four times each day so that ewes could be assisted in case of difficult lambing. No such assistance was required with any of the ewes. In most cases, first weights of the lambs were taken at 12 hours of age or less. The lambs of one ewe were weighed at 48 hours. Each lamb was given a metal ear tag at time of weighing. All lambs were docked and male lambs were castrated at one to two weeks of age.

Tables 7, 8, 9, 10, and 11 give data as to the ewes that lambed, with a description of each and the sex and birth weight of each lamb.

Twelve of the ewes died before lambing time. Seven of the ewes that lived through failed to lamb. The whole flock of ewes dropped 127 lambs, or an average for the flock of 1.16 lambs. The average for the ewes that lambed was 1.4 lambs.

#### Effect of Age upon Production

At the time of taking descriptions of the ewes, in August, 1920, an estimate was made of the age of each ewe. Fairly accurate estimates could be made for the younger ages, but the older ages are merely by the condition of the teeth. The following table gives the result by ages of the production of the ewes:

Table 11--Summary of Birth Data by Ages of Ewes.

Ages yrs.	No. of ewes lambing	No. of lambs dropped	Av. weight of lambs at birth	Per cent of ewes having twins	Av. No. of lambs per ewe of each age
1	6	9	9.49	--	--
2	12	14	11.11	14.3	1.16
3	8	13	9.22	55.3	1.62
4	21	33	9.13	57.1	1.57
5	23	32	9.84	42.5	1.39
6	12	14	9.00	16.6	1.16
7	4	5	9.20	----	----
8	5	7	9.57	----	----
Total	91	127	Average:	39.5	1.39

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. This is essential for ensuring the integrity of the financial statements and for providing a clear audit trail. The records should be kept up-to-date and should be easily accessible to all relevant parties.

2. The second part of the document outlines the various methods used to collect and analyze data. These methods include interviews, surveys, and focus groups. Each method has its own strengths and weaknesses, and it is important to choose the most appropriate method for the specific research objectives.

3. The third part of the document describes the process of data analysis. This involves identifying patterns and trends in the data, and then interpreting these findings in the context of the research objectives. It is important to be objective and unbiased in this process, and to avoid drawing conclusions that are not supported by the data.

4. The fourth part of the document discusses the importance of communicating the results of the research. This involves writing a clear and concise report that summarizes the findings and provides recommendations for future action. It is important to use plain language and to avoid technical jargon, so that the results can be understood by a wide range of stakeholders.

5. The fifth part of the document discusses the importance of ethical considerations in research. This includes obtaining informed consent from participants, protecting their privacy, and ensuring that the research is conducted in a fair and equitable manner. It is important to be transparent about the research process and to be open to criticism and feedback.

It is evident from the data shown in Table 11 that a ewe reaches her maximum production at the age of four years, after which there seems to be a steady decline. The per cent of ewes having twins at three years of age was 55.3, and of those at four years 57.1. The average number of lambs per ewe at three years of age was 1.62, at four years 1.57, and at five years 1.39. The number of ewes of three years of age having lambs is a little too small to justify definite conclusions. There seems, however, to be a decline in the per cent of ewes having twins after the fourth year. Of all the ewes lambing, 39.5 per cent had twins, and the average number of lambs per ewe for the 91 ewes that lambled was 1.39.

#### Effect of Type of Ewe upon Lamb Production

For a number of years there has been a prevalent opinion among lamb raisers of Middle Tennessee that the common white-faced ewes that show but little breeding are better for lamb production than ewes showing some blood of the dark-faced breeds. Since in this experiment there was nearly an equal distribution of white-faced ewes in each flock, there has been an excellent opportunity for studying the difference between these two types of ewes on lamb production. Table 12 shows the apparent effect of type of ewe upon lamb production in this experiment. White faced ewes in this experiment were mostly common Alabama ewes. Dark faced ewes were those of improved breeding.

Table 12--Effect of type of ewe on lamb production.

Description of ewes	No. of ewes lambing	Av. No. of lambs dropped	Av. date of lambing	No. ewes raising lambs to market	Av. wt. of lambs marketed per ewe raising lambs. Lbs.	Av. wt. of lambs marketed per ewe lambing.	Av. daily gain of lambs Lbs.
White faces	41	1.24	March 5	31	82.9	62.7	.82
Dark faces	50	1.52	March 8	48	99.1	95.2	.79

The white-faced ewes dropped an average of 1.24 lambs each, and the dark-faced ewes an average of 1.52 lambs each. The average date of lambing of the white-faced ewes was March 5, and of the dark-faced ewes March 8. The white-faced ewes did not prove as good mothers as the dark-faced ewes. They raised fewer of their lambs to market age, and brought them to market time at a less average weight. The average weight of lambs marketed per ewe raising lambs of the white faces 82.9 pounds, and of the dark faces 99.1 pounds. If we consider all the white-faced ewes that lambed as against all the dark-faced ewes that lambed, the average weight of lambs marketed per ewe of the white faces that lambed was 62.7 pounds, and of the dark faces 95.2 pounds. The average daily gain of lambs of the white face ewes was .82 pounds, and of lambs of the dark faced ewes .79 pound. This apparent discrepancy was due to the fact that the white faced ewes raised more single lambs than the dark-faced ewes. The white-faced ewes produced nine pairs of twins but raised only three unbroken pairs. The dark-faced ewes produced 24 pairs of twins and raised 19 unbroken pairs. Only 75.8 per cent of the white-faced ewes lambing raised one or more of their lambs to market age, against 95.9 per cent of the dark-faced ewes.

### Effect of Condition of Ewe on Lamb Production

At the time of the beginning of the experiment, in August, 1920, each ewe was described, with reference to the condition of flesh at that time, as thin, fair, or good. In this respect the four groups were about equally divided, as reference to Table 12 will show. It has been asserted by many lamb breeders that ewes thin in condition would lamb earlier and produce more lambs than those in good condition. Table 13 will show the effect of the condition of the ewes in this experiment on lamb production.

Table 13--Effect of condition of ewe on lamb production.

Condition of ewe	Total No. of ewes lambing	Av. No. of lambs per ewe dropped	Av. date of lambing	No. of ewes raising lamb to market	Av. wt. of lamb* per ewe raising lambs	Av. wt. of lamb* per ewe lambing	Av. daily gain of each lamb
Thin	13	1.31	March 10	12	91.8	84.6	.76
Fair	32	1.34	March 4	24	97.9	73.5	.81
Good	46	1.45	March 7	43	92.7	86.7	.80

\*"Lamb" refers to total weight of lambs per ewe in each case.

There were 13 ewes classed as thin, 32 as fair, and 46 as good. The ewes in thin condition dropped an average of 1.31 lambs, those that were fair in condition, 1.34, and those that were good, 1.45. The average date of lambing was practically the same for each group, with the odds in favor of the ewes that were fair to good in condition. The average weight of lamb marketed per ewe for those producing and raising lambs was, for the thin ewes, 91.8 pounds, for the fair ewes 97.9 pounds, and for the good ewes 92.7 pounds. The average daily gains were greater for the lambs produced from ewes in fair to good condition in the fall. The most significant fact brought out by the table is that the ewes that were in fair to good condition dropped a larger percentage of twins than those that were thin.

#### Effect of Lamb Production of Driving Ewes

In the earlier history of early spring lamb production by farmers in Middle Tennessee, it was the custom to purchase common ewes in the state lying south, or from the Cumberland Plateau in Tennessee, during the month of July or the forepart of August, and then drive them through the country to the farm destination where they were to be kept during the winter months. After these long drives, the ewes were turned onto the fresh pasture that had been preserved for them by the new owner and the ram turned with the ewes. It was observed that these ewes lambed earlier than the ewes that had been kept throughout the year in the same locality. Hence, the theory arose that if ewes were driven for some distance on the road or about the pasture field before the rams were turned in at the breeding season most of the ewes would immediately come into season, and the birth date of the lambs would be bunched at the

earliest possible date after the ram was turned with the flock. In order to test the accuracy of this theory, each group of ewes was divided into two equal flocks on August 14, 1920, and one each of the flocks was turned into a general flock and driven on the public highway for a distance of seventeen miles. The drive consumed most of the day. On page 3 is given a list of the ewes of each group that were sent on the drive. Table 14 will show the apparent lack of effect of driving upon the date of lambing.

Table 14--Results on lamb production of driving ewes.

	No.	No. of ewes lambing	Av. date of lambing	Av. No. of lambs per ewe lambing
Ewes driven	56	44	Mar. 13	1.45
Ewes not driven	54	47	Mar. 3	1.34

For the 56 ewes that were driven the average date of lambing was March 13, for the 54 ewes not driven the average date of lambing was March 3. The ewes not driven lambed, on ~~the~~ average, ten days earlier than the ewes that were driven. The average number of lambs dropped per ewe was in favor of the ewes that were driven, being 1.45 lambs. For the ewes not driven the average was 1.34 lambs. In this one year's trial there is not much to prove the accuracy of the theory that long drives will cause ewes to breed at an earlier date. Such difference as does exist is in favor of the ewes not driven.

Production of Ewes of Each Group that Produced  
Lambs that were Marketed.

Complete data were kept on each living lamb. Data were also kept on all ewes throughout the year. The following table will show the production of ewes of each group:

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that this is essential for ensuring transparency and accountability in the organization's operations.

2. The second part of the document outlines the various methods and tools used to collect and analyze data. It highlights the need for consistent and reliable data collection processes to support informed decision-making.

3. The third part of the document focuses on the role of technology in modern data management. It discusses how advanced software solutions can streamline data collection, storage, and analysis, leading to more efficient and accurate results.

4. The fourth part of the document addresses the challenges associated with data security and privacy. It provides guidance on implementing robust security measures to protect sensitive information from unauthorized access and breaches.

5. The fifth part of the document explores the importance of data quality and integrity. It discusses strategies for identifying and correcting errors in data collection and analysis to ensure the reliability of the information used for decision-making.

6. The sixth part of the document discusses the role of data in strategic planning and performance management. It highlights how data-driven insights can help organizations identify trends, opportunities, and areas for improvement, leading to more effective strategic execution.

7. The seventh part of the document focuses on the importance of data governance and compliance. It discusses the need for clear policies and procedures to ensure that data is collected, stored, and used in a manner that complies with relevant laws and regulations.

8. The eighth part of the document discusses the role of data in customer relationship management (CRM). It highlights how data can be used to better understand customer needs and preferences, leading to more personalized and effective marketing and sales strategies.

9. The ninth part of the document discusses the importance of data in human resources management. It highlights how data can be used to track employee performance, identify training needs, and improve overall organizational productivity.

10. The tenth part of the document discusses the role of data in financial management. It highlights how data can be used to monitor financial performance, identify cost-saving opportunities, and make more informed investment decisions.

Table 15--Production of ewes of each group that produced lambs that were marketed.

Group	No. of ewes living at market time that had lambs marketed	No. ewes dead at market time that had lambs marketed	Av. wt. of living ewes June, 1921 LBS.	Av. gain of living ewes	No. lambs born	Av. wt. of lambs at birth Lbs.	No. of lambs marketed	No. of lambs per ewe	Total wt. of lambs marketed per ewe Lbs.
I	19	1	125.5	22.2	32	9.58	26	1.30	88.5
II	21	0	120.8	20.8	28	9.36	25	1.19	80.2

IV	<u>14</u>	<u>1</u>	122.0	24.6	30	9.72	<u>19</u>	<u>1.36</u>	94.0
	75	4					102	1.39	

Most of the ewes made from 20 to 25 pounds gain during the year from August 14, 1920, to May 27, 1921. The average gain made by each group of ewes was practically the same. The average birth weight of Southdown lambs was 9.58 pounds, of Shropshire lambs, 9.72. The average number of lambs dropped per ewe was practically the same for each group.

When most of the lambs were ready for market, the Nashville Stock Yards Company, of Nashville, Tennessee, were requested to send some one to the Experiment Station to grade the lambs. They kindly sent Mr. G. L. Watkins, who has had many years' experience in buying lambs on Louisville, Chicago and Nashville markets. The lambs were graded in three market classes, fancy select, medium, and good. Most of the lambs were marketed May 27. A few of the smaller ones marketed on July 1. Table 16 gives data of all lambs marketed.

Fig. 3. Southdown Lambs. 1920-21.

### Market grades of Lambs of Each Breed

In grading the lambs into three groups, fancy select, medium, and good, Mr. Watkins made the statement that the lines of demarcation between the groups as he has made them were very slight. It was his opinion that the lambs in the lower grades were younger lambs and would have graded fancy select had they been given a few more days in which to mature. The grading of the lambs for each breed were according to Table 18.

Fig. 5. Hampshire Lambs. 1920-21.

Fig. 6. Oxford Lambs. 1920-21.

Table 18--Market grade of lambs of each breed.

Group	Total No. lambs sold	No. grad- ing fancy selects	Av. age in days fancy select	No. grad- ing medium	Av. age in days medium	No. grad- ing good	Av. age in days Good	Per cent of each group grading fancy select
Southdown	26	18	100	4	83	4	67	69
Shropshire	25	16	89	5	86	4	67	64
Hampshire	31	20	103	6	87	5	94	64
Oxford	19	9	96	3	77	7	74	47
TOTAL: 101		63		18		20		
Average:			97		84		81	

Of the 101 lambs marketed 63 graded as fancy select, 18 as medium, and 20 as good. It was noticed from the table that the data compiled after the lambs were marketed verifies Mr. Watkins' statement regarding the age of the two lower grades. The average age of the lambs grading as fancy select was 97 days, of those grading as medium, <sup>84 days</sup> and of those grading as good or below, 81 days. The per cent of each group grading as fancy select was as follows: Southdown 69, Shropshire 64, Hampshire 64, and Oxford 47.

Gains made by Lambs Marketed of Each Breed.

The influence of the breed of the sire on gains of lambs produced from common ewes seemed to be directly proportionate to the size of the breed of the ram used in each case. Table 19 is given to show gains made by lambs sired by rams of each of the following breeds: Southdown, Shropshire, Hampshire, and Oxford.

Table 19--Gains made by lambs marketed of each breed.

Group	Total lambs	Av. age of each lamb days	No. twin lambs	No. single lambs	Av. Daily gain each lamb Lbs.	Av. daily gain of lamb per ewe Lbs.	Av. wt. of lambs each breed	Av. total wt. of lambs per ewe Lbs.
I Southdown	26	92.2	14	12	.74	.967	68.1	89.16
II Shropshire	25	85.1	9	16	.79	.982	67.4	83.57
III Hampshire	32	97.4	20	12	.82	1.148	78.9	111.81
IV Oxford	19	84.6	9	10	.87	1.181	74.2	99.91

The average daily gains made by the lambs sired by the ~~names~~ of the respective breeds were as follows: Southdown 74 pound; Shropshire .79 pound; Hampshire .82 pound; and Oxford .87 pound. The average weights of lambs of the various breeds at the time of marketing were as follows: Southdown 68.1 pounds, Shropshire lambs 67.4 pounds, Hampshire lambs 78.9 pounds, and Oxford 74.2 pounds. The Southdown and Hampshire lambs averaged a few days older than the Shropshire and Oxford lambs. The Southdown lambs were slightly larger than the Shropshire lambs, and the Hampshire lambs slightly larger than the Oxford lambs. The differences could be accounted for partly by differences in age. The Southdown and Hampshire lambs were practically of the same age as were also the Shropshire and Oxford lambs, and may therefore be compared on that ~~same~~ basis. The Hampshire lambs were 10.8 pounds larger than the Southdown lambs, and the Oxford lambs were 6.8 pounds larger than the Shropshire lambs. The percentage of lambs of each of the first three groups, namely, Southdown, Shropshire, and Hampshire, that graded as fancy select were practically the same, and sold at a price of  $12\frac{1}{4}$  cents per pound for lambs marketed. The Southdown lambs averaged \$8.34 each, the Shropshire lambs \$8.45, the Hampshire lambs \$9.56.

Table 20--Gains by sex of lambs marketed.

	Total No. lambs	Total No. wether lambs	Total No. ewe lambs	Av. daily gain wether lambs Lbs.	Av. daily gain ewe lambs Lbs.
Group I Southdown	26	11	15	.73	.75
" II Shropshire	25	13	12	.79	.79
" III Hampshire	32	14	18	.82	.79
" IV Oxford	19	13	6	.87	.88
Totals	102	51	51		
			Averages	.80	.79

The average gain made by lambs in each group were practically the same for the two sexes. The average gain of all wether lambs was .80 pound, and of all ewe lambs .79 pound. The average daily gain of all lambs was .795 pound.

## PART II. 1921-22.

The plan for the experiment during this year was the same as for the previous year except that one more group was added to the experiment, which group was headed by scrub rams. The total number of ewes was increased to 159 head. There were 60 ewes with unbroken mouths and that had good lambing records which were held over from the previous year. These were added to by purchases of common ewes. On July 11 there were purchased 23 common white-faced ewes averaging 97.5 pounds at \$4.00 each and on July 16 there were purchased 76 head averaging 96.5 at \$4.75 each. On August 6, 1921 the ewe flock was divided into 5 flocks as nearly equal as possible with regard to black, mottled, gray, buff and white faces, with regard to ages, and also so divided that the ewes used the previous year were divided among the five flocks. All ewes not bearing labels were given aluminum ear tags and descriptions and weights taken as of the previous year. The ewes carried over from the previous year are described in these notes as "old ewes", meaning that they were used the previous year.

On August 8, 1921 the descriptions, weighings, and division into flocks had been completed. Each flock was then divided and one-half of each turned into a common flock and were sent on a 17 mile drive. They were started at 7:30 A. M. and returned to the barn at 4 P. M. They were then sent to their respective flocks. Each flock was kept in a small

enclosure in the barn for the night and the rams turned for the first time with their respective flocks. The following are the ewes that were sent on the drive.

<u>Group I</u>		<u>Group II</u>		<u>Group III</u>		<u>Group IV</u>		<u>Group V</u>	
New ewes	Old ewes	New ewes	Old ewes	New ewes	Old ewes	New ewes	Old ewes	New ewes	Old ewes
151	21	171	1	193	6	211	2	231	40
152	57	172	11	194	7	212	8	232	41
154	71	173	13	195	50	213	10	236	79
156	74	174	52	200	97	214	18	237	86
157	118	175	80	201	104	215	34	239	253
158		177		202	251	219	53	241	
159		184		204		222	70	242	
162		185		207		225		246	
163		188		208		227		346	
165		189		209		229			

Throughout the fall, winter and spring the flocks were handled as they were the previous year. During the breeding season the flocks were changed or rotated on pasture every two weeks. On December 1 all rams were taken out and all the flocks turned into one common flock and pastured throughout the winter on crimson clover and rye. Each ewe was in the open throughout the whole winter and spring without hay or grain except for about a week for each ewe at lambing time when, in order to give proper attention, they were kept under an open shed. They were salted and counted twice each week.

Lambs were weighed at birth and given an aluminum ear tag. Also sex and time of day was noted.

Breeds of Rams Used 1921-22

The same breeds were used as for the previous year except that a scrub ram group was added. Group I was headed with two yearling Southdown rams purchased of a reputable breeder.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that this is essential for ensuring transparency and accountability in the organization's operations.

2. The second part of the document outlines the various methods and tools used to collect and analyze data. It highlights the need for consistent data collection procedures and the use of advanced analytical techniques to derive meaningful insights from the data.

3. The third part of the document focuses on the role of technology in data management and analysis. It discusses how modern software solutions can streamline data collection, storage, and processing, thereby improving efficiency and accuracy.

4. The fourth part of the document addresses the challenges associated with data management, such as data quality, security, and privacy. It provides strategies to mitigate these risks and ensure that the data remains reliable and secure throughout its lifecycle.

5. The fifth part of the document concludes by summarizing the key findings and recommendations. It stresses the importance of ongoing monitoring and evaluation to ensure that the data management processes remain effective and aligned with the organization's goals.

Fig. 7. Ewes and Lambs on Crimson Clover in March, 1922.

Fig. 8. Ewes and Lambs on Crimson Clover in March, 1922

Only one ram was with the flock at a time. These two rams were rotated with the flock every two weeks. Group II was headed with the Shropshire ram purchased and used after October 28, 1920 in the previous year's work. Group III was headed by the Hampshire ram that was used the previous year. Group IV was headed by a three-year-old Oxford ram purchased of a reputable Ohio breeder. Group V was headed by three-year-old scrub rams purchased locally. They were strong, vigorous scrub rams, but showed no particular breed characteristics. They were rotated with their flock as described for Group I.

Description of Ewes

Tables 1, 2, 3, 4 and 5 give weights and descriptions of individual ewes as taken August 6, 1921. A column was added which gives weights of fleeces on May 3, 1922.

Management of Ewes During Lambing Season

The ewes and lambs were managed as they were the previous year except each ewe was put in shed for a week at lambing time. Lambs were weighed at birth, sex noted, and each lamb labelled. Table 7 gives the data collected.

QUESTION 1: (10 marks)

- a. Define the following terms:
  - **Production function:** A mathematical relationship between inputs and outputs.
  - **Input:** A factor of production used in the production process.
  - **Output:** The result of the production process.
  - **Technology:** The state of knowledge about the production process.

Fig. 11. Hampshire Ram Used Both Years.

Fig. 12. Oxford Ram Used 1921-22.

Three of the ewes died before lambing and seven were reported as not lambing. The whole flock of ewes dropped 231 lambs or an average for the flock of 1.45. The average for the ewes that lambled was 1.55.

Effect of Age of Ewe upon Production.

Estimates were made of the age of each ewe in August 1921, as was done the previous year. The following table gives a summary of birth data by ages of ewes:

Table 8. Summary of Birth Data by Ages of Ewes.

<u>Ages Yrs.</u>	<u>No. of ewes lambing</u>	<u>No. of lambs dropped</u>	<u>Av. wt. of lambs at birth</u>	<u>Per cent of ewes having twins or triplets</u>	<u>Av. No. of lambs per ewe of each age</u>
1	14	20	8.31	42.7	1.43
2	10	14	8.75	40.0	1.40
3	16	24	10.37	50.0	1.50
4	18	22	10.13	22.2	1.11
5	21	38	9.30	77.3	1.81
6	29	49	9.25	58.5	1.68
7	16	27	8.54	62.4	1.68
8	25	38	8.76	52.1	1.52
<hr/>					
<b>Totals</b>	<b>149</b>	<b>231</b>			
		<b>Averages</b>	<b>9.22</b>	<b>55.7</b>	<b>1.55</b>

There seems to be an increase in fecundity from 3 to 7 years. The average number of lambs was highest at 5 years of age. At 8 years of age the ewe begins to lose vitality and fecundity.

Effect of Type of Ewe upon Lamb Production

The ewes during the year 1921-22, described according to color of face and legs. Those with dark or colored faces showed traces of breeding of the down breeds, while those with white faces showed but little improved breeding.

Table 9.

Effect of Type of Ewe on Lamb Production

<u>Description of ewe</u>	<u>No. of ewes lambing</u>	<u>Av. No. lambs dropped</u>	<u>Av. date of lambing</u>	<u>No. ewes raising lambs to market</u>	<u>Av. wt. of lambs marketed per ewes raising lambs</u>	<u>Av. daily gain of lambs.</u>
White faces	89	1.56	Feb. 3	85	100.3	.67
Dark faces	60	1.53	Feb. 10	54	101.1	.70

There was practically no difference between dark-faced and white-faced ewes in their production of lambs. The average date of lambing for the white-faced ewes was one week earlier than the dark-faced ewes, but on the other hand the dark-faced ewes produced an average of one pound more of lamb for the market.

Effect of Condition of Ewe at Breeding Time on  
Lamb Production.

Data was again collected in 1921-22 experiments on the condition of ewes at the beginning of the breeding season. They were described as "thin", "fair", or "good", according to the amount of flesh they carried. They were well distributed between the groups, (see Table 6).

Table 10. Effect of Condition of Ewe on Lamb

<u>Condition of ewe</u>	<u>Total No. ewes lambing</u>	<u>Production</u>		<u>Av. wt. of lamb marketed per ewe lambing</u>	<u>Av. daily gain of each lamb</u>
		<u>Av. No. of lambs dropped per ewe</u>	<u>Av. date of lambing</u>		
Thin	37	1.46	Feb. 12	93.0	.68
Fair	44	1.41	Feb. 8	88.7	.68
Good	68	1.68	Jan. 31	101.1	.71

There were 37 ewes classed as "thin", 44 as "fair", and 68 as "good". The ewes in thin condition bred an average of 13 days later than those in good condition at time of turning in the ram, dropped .22 less lambs per ewe, and marketed 8.1 lbs. less per ewe. It seems to be important that the ewes be in good condition at the beginning of the breeding season. If ewes in good condition will breed from one to two weeks earlier and produce more lambs per ewe than ewes in thin condition, it means that the profits may be much more per ewe owing to more favorable markets and more lamb. Such difference in gain of lambs was in favor of the lambs from ewes in good condition.

Effect on Lamb Production of Driving Ewes

The flocks were divided as in the previous year and one half of each flock given a drive of 17 miles. Upon returning each ewe was returned to its respective group and rams turned with their respective groups. The plan was modified this year at the suggestion of sheep men by putting each flock in a small enclosure in the barn for the first night. The following table gives the results:

Table 11. Results on Lamb Production of Driving Ewes

	<u>No.</u>	<u>No. of ewes lambing</u>	<u>Av. date of lambing</u>	<u>Av. No. of lambs per ewe lambing</u>
Ewes driven	78	75	Feb. 8	1.60
Ewes not driven	81	74	Feb. 4	1.50

Effect of Castration on Male Lambs.

While in this data no check of our uncastrated male lambs were kept yet the data from the ewe lambs may be offered as a partial check. It was, for example, that the average daily gain of the wether lambs was .71 pound while that of the ewe lambs was .67 pound. Apparently the castration of the male lambs did not check their growth.

The average date of lambing for the ewes that were driven before turning the rams with them was Feb. 8, and for the ewes not driven, it was Feb. 4. These results check with the previous. Evidently there is no benefit to be derived from giving ewes a long drive before turning in the rams.

Influence of Rams of Various Breeds upon Production of  
Early Spring Lambs.

Complete data was kept on all ewes (see page ), as was also for each lamb, including the grade of the carcass after slaughter in Chicago. The following table will show the production of the ewes of each group:

Table 12. Production of Ewes of Each Group, 1922, that Produced  
Lambs that were Marketed.

Group	No. of ewes living at market time that marketed lambs	No. of ewes dead at market time that marketed lambs	Av. wt. living ewes June 1922	Av. gain living ewes	No. lambs born	Av. birth wt. lambs born	No. of lambs marketed	No. of lambs marketed per ewe	Av. total wt. of lambs marketed per ewe
I	21	0	120.5	8.0	31	9.25	28	1.33	92.5
II	30	3	115.6	11.5	55	8.33	54	1.64	110.0
III	28	4	122.5	14.1	48	9.50	41	1.28	93.7
IV	23	4	125.4	15.8	39	10.20	38	1.41	102.5
V	26	2	125.9	17.6	44	9.25	44	1.57	103.0
	128	13			217		205		

The average gain of ewes of the various groups was from 8 to 17 pounds. The average birth weight was largest for lambs served by the Oxford ram. Hampshire and Southdown lambs were nearly the same and Shropshire the smallest at birth.

When the lambs were ready for market they were separated from their dams and put in a pen and graded into market classes by Mr. G. L. Watkins, Nashville, Tenn. assisted by Mr. C. C. Flanery, Nashville, Tenn. There were two shipments, one on May 3d, and the other on June 9th. The lambs for the first shipment were graded into the classes, Prime, Good, and Seconds. The second shipment was graded into Prime, Good, Second, and Culls. After the grading was completed, complete records were made of each lamb. The lambs were shipped and sold by grade on the Nashville Market and then consigned to Armour & Company, Chicago, Ill., where slaughter data of each carcass were collected, including dressing percentages and market carcass grading. As the head was severed from the carcass the ear label was slit from the ear and then fastened to the carcass. There was, therefore, the least possible chance of knowing at the time of grading the breed of the carcass. Tables 13 and 14 give the data collected on lamb and its dam.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that this is crucial for ensuring transparency and accountability in the organization's operations.

2. The second part of the document outlines the various methods and tools used to collect and analyze data. It highlights the need for consistent data collection procedures and the use of advanced analytical techniques to derive meaningful insights from the data.

3. The third part of the document focuses on the role of technology in data management and analysis. It discusses how modern software solutions can streamline data collection, storage, and processing, thereby improving efficiency and accuracy.

4. The fourth part of the document addresses the challenges associated with data collection and analysis. It identifies common issues such as data quality, data integration, and data security, and provides strategies to overcome these challenges.

5. The fifth part of the document discusses the importance of data governance and compliance. It emphasizes the need for clear policies and procedures to ensure that data is collected, stored, and used in a manner that complies with relevant laws and regulations.

6. The sixth part of the document concludes by summarizing the key findings and recommendations. It reiterates the importance of a data-driven approach and the need for continuous improvement in data collection and analysis practices.

In explaining grading of carcasses, Mr. H. A. Phillips, of Armour & Company, wrote on May 9, 1922:

"Our S grade lambs are strictly choice; in fact, they are the lambs that are supposed to be fancy. The lambs graded R are very good quality but not strictly good enough to be termed fancy, but they are good selling lambs. Our M Grade lambs are medium; they are better than culls, but the word medium describes their quality. Quite a good many of these R lambs, you will note, carry considerable weight and a lot of them were strictly choice in quality but are too heavy to be thrown into our S grade of lambs. We make 45# maximum on S lambs.

In going through this bunch of lambs I gave carcass #103 First, carcass 140 Second and carcass 138 Third, and I also recommended carcasses 147, 148, and 166 as being far above the average. Carcasses 147 and 148, you will notice, are light weights but they were certainly good; lacked just a little of being full in the loin. Outside of this they were pretty nearly perfect. No. 103, our first choice, is a mighty fine individual, extra good in the legs and loin, good thickness of rib but just is a little heavy in the shoulder and neck. This is the only criticism that I have on this lamb. No. 140 was an excellent individual; a little longer in the body and not quite as good in the legs but a good thick lamb. No. 138 was smooth in every way. If he had been coupled a little shorter and carried a trifle more flesh he would have been our first choice. You understand that the dressed weight on these individuals is the hot weight shrunk 3% to take care of our shrink in the cooler. This bunch of lambs killed in the whole made a little over 52% shrunk, which is a very high dressing, in fact, are better than we get out of our straight purchases on the Nashville market."

The carcass ranking first was sired by a Hampshire ram, second, by a Southdown ram, and third, by a Shropshire ram. Carcasses given honorable mention were 147 by Southdown sire, 148 by Shropshire sire, and 166 by Southdown sire.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. This is essential for ensuring the integrity of the financial statements and for providing a clear audit trail. The records should be kept up-to-date and should be easily accessible to all relevant parties.

2. The second part of the document outlines the various methods used to collect and analyze data. These methods include interviews, surveys, and focus groups. Each method has its own strengths and weaknesses, and it is important to choose the most appropriate method for the specific research objectives.

3. The third part of the document describes the process of data analysis. This involves identifying patterns and trends in the data, and then interpreting these findings in the context of the research objectives. It is important to be objective and unbiased in this process, and to avoid drawing conclusions that are not supported by the data.

4. The fourth part of the document discusses the importance of communication in the research process. This involves sharing the findings of the research with the relevant stakeholders, and ensuring that the information is presented in a clear and concise manner. It is also important to listen to the feedback of these stakeholders, and to use this feedback to improve the research process.

5. The fifth part of the document outlines the various ethical considerations that must be taken into account when conducting research. These include the need to obtain informed consent from all participants, to ensure the confidentiality of the data, and to avoid any potential conflicts of interest.

6. The sixth part of the document describes the various methods used to ensure the reliability and validity of the research. These include the use of standardized procedures, the use of multiple sources of data, and the use of triangulation.

7. The seventh part of the document discusses the importance of transparency in the research process. This involves making all aspects of the research process, including the data and the analysis, available to all relevant parties. This helps to ensure the integrity of the research and to allow others to replicate the study.

8. The eighth part of the document outlines the various methods used to disseminate the findings of the research. These include the use of reports, articles, and presentations. It is important to choose the most appropriate method for the specific audience, and to ensure that the findings are presented in a clear and concise manner.

9. The ninth part of the document discusses the importance of ongoing evaluation and improvement of the research process. This involves regularly reviewing the progress of the research, and making adjustments as needed. It is also important to seek feedback from the relevant stakeholders, and to use this feedback to improve the research process.

10. The tenth part of the document outlines the various methods used to ensure the long-term sustainability of the research. These include the use of open access, the use of digital archiving, and the use of social media. It is important to choose the most appropriate method for the specific research, and to ensure that the findings are accessible to all relevant parties.

In the second shipment of lambs the three best lambs were, 274, sired by the Shropshire ram, ranking first; 276, by the Hampshire ram, second; and 266, by a Southdown ram, third.

\*Weight at Middle Tennessee Station barn.

The first shipment of lambs sold on the Nashville market May 3rd for Prime lambs, at \$18.00, for Good, \$16.50 and Seconds, for \$12.50. Table 16 shows the price received per head for lambs sired by rams of the various breeds. The average received per head for the Southdown lambs was \$12.10, for the Hampshire lambs \$13.99, for the Oxford lambs \$12.89, and for the scrub lambs \$10.95. The average age of each was about the same. The average daily gains were greatest for the Hampshire and Oxford lambs.

\*Including birth weight.

\*Based on College barn weights.

Table 17 is a summary showing grading of carcasses in first shipment. It will be noted that in this shipment the Southdown carcasses ranked first, with 87 per cent of the carcasses grading as S; Shropshire second, with 70 per cent; Oxford third, with 67 per cent; Hampshire fourth, with 53 per cent; and Scrubs last, with 50 per cent. The general classification of the carcasses was similar to the classification on foot. There was not much difference in the dressing percentages.

Tables 18, 19 and 20 summarize the classifications of the second shipment of lambs, made on June 9th. This shipment was graded and sold in the same manner as the first. Since it was the final shipment of all the lambs on hand it was a much more uneven lot of lambs. Some of the lambs lacked age and weight to make good market lambs. The first shipment was a better criterion as to the rank of the various breeds for early spring lamb production.

Table 18. Market Grading on Foot, Second Shipment.

Number	Total weight at Station				Average weight

Fig. 13. Scrub Ram Used 1921-22.

Fig. 14. Scrub Ram Used 1921-22.

Regarding the second shipment of lambs there was not much to be said of any breed as being better than any other when ages and weights of the lambs were considered, except that the Scrub lambs ranked lowest. They were but an average of one day younger than the Southdowns and sold for but 52 per cent as much. Also 60 per cent of their carcasses graded in the M grade or below.

The data for both shipments have been combined and are presented in the following Table 21, in order to show the average results of all the data relating to the influence of the breed of the sire of the lambs.

Table 21. Summary of Lambs Marketed of Each Breed, Both Shipments.

Breed of Group sire	Total of lambs	Av. age of each lamb	Days	No. twin lambs	No. single lambs	Av. daily gain of each lamb	*Av. wt. of each bred	Av. dressing percentage	Per cent average of lamb carcass graded as S	Price rec'd per head
I Southdown	28	104	17	11	.67	69.2	51.8	85.6	\$10.61	
II Shropshire	54	102	40	14	.66	67.2	50.0	51.9	9.58	
III Hampshire	40	97	25	16	.75	73.1	51.4	50.0	11.40	
IV Oxford	39	105	23	15	.69	72.9	49.3	53.8	10.33	
V Scrub	44	98	31	13	.68	65.5	50.4	27.3	8.09	

\*Birth weight included.

The Hampshire lambs, during the year 1921-22, ranked first in the rate of gain per day, the average weight of lambs marketed, and the price received per lamb marketed, and second in dressing percentage. Southdowns ranked second in price received per head, first in dressing percentage, and third in size. It is well to note, however, that the differences in these various factors with lambs sired by purebred rams are not great, but that there is a marked depreciation in value of lambs sired by scrub rams. The average received per lamb for all sired by purebred rams was \$10.40, while Scrub lambs averaged but \$8.09 each, making a difference of \$2.31. Had Group V ewe flock been headed by a ram of one of the Down breeds tested, the returns based on data from the other four flocks would have been \$101.64 greater. The lambs sired by the Southdown ram ranked first in the grading of the carcasses, although the <sup>ranking</sup> individual carcass of the first shipment was sired by a Hampshire ram, and the first carcass of the second shipment by a Shropshire ram.

Fig. 15. Lambs on Crimson Clover May 3, 1922.

Influence of Twinning on Market  
Returns.

The distribution of twins between the various groups is even enough, and we have sufficient data to make a study of the influence on returns per ewe worth while. Ewes having twins but raising only one of them to market age have been counted as raising single lambs.

Table 22.                   Influence of Twinning.

	No. ewes	No. lambs	Total price received	Average price per ewe
Ewes marketing single lambs	79	79	\$867.96	\$10.98
Ewes marketing two or three lambs	61	125	1161.28	19.09

---

Ewes that raised two lambs till time for marketing brought in a return of \$19.09 each from lambs sold, while ewes that raised but one brought in but \$10.98. Two lambs from one ewe sold for \$34.58.

**SUMMARY OF TWO YEAR'S DATA ON PRODUCTION  
OF EARLY SPRING LAMBS**

- 1. Influence of Top Crosses of Different Breeds.**
- 2. Comparison of Dark-Faced and White-Faced Ewes.**
- 3. Effect of Condition of Ewes at Breeding Season.**
- 4. Effect of Driving Ewes.**

- - - - -

1. It seems evident from data collected on 269 ewes that a ewe reaches her maximum production at four to six years. The average number of lambs dropped in 1921 for 3 year ewes was 1.32, for 4 year ewes 1.57, for 5 year ewes 1.39; in 1922 for 3 year ewes 1.50, for 5 year ewes 1.31, and for 7 year ewes 1.68.

2. Common ewes, showing no particular breeding, were less efficient in 1921 than dark-faced ewes showing some blood of the Down breeds, but practically equal in 1922. In 1921 the white-faced ewes dropped an average of 1.24 lambs, in 1922 an average of 1.56, and the dark-faced ewes in 1921 an average of 1.58 lambs and 1.55 lambs in 1922.

3. The average date of lambing for the white-faced ewes was three days earlier in 1921 and seven days earlier in 1922 than the black-faced ewes.

4. Common white-faced ewes raised an average of 62.7 pounds of lamb to market age in 1921 and 100.3 pounds in 1922, the dark-

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that this is crucial for ensuring transparency and accountability in the organization's operations.

2. The second part of the document outlines the various methods and tools used to collect and analyze data. It highlights the need for consistent data collection procedures and the use of advanced analytical techniques to derive meaningful insights from the data.

3. The third part of the document focuses on the implementation of data-driven strategies. It provides a detailed overview of the key steps involved in developing and executing these strategies, from identifying opportunities to monitoring and evaluating their performance.

4. The fourth part of the document discusses the challenges and risks associated with data-driven decision-making. It identifies common pitfalls and offers practical advice on how to mitigate these risks and ensure the successful implementation of data-driven strategies.

5. The fifth part of the document provides a comprehensive overview of the current state of data-driven decision-making in various industries. It highlights the latest trends and innovations, as well as the impact of these changes on the overall business landscape.

6. The sixth part of the document concludes with a summary of the key findings and recommendations. It emphasizes the importance of a data-driven approach and provides a clear roadmap for organizations looking to optimize their performance through data-driven decision-making.

faced ewes 95.2 pounds in 1921 and 101.1 pounds in 1922.

5. Condition of ewes at the beginning of the breeding season seems to have a marked influence on the usefulness of the ewe for early spring lamb production. Ewes in thin-to-fair condition averaged 1.33 lambs each in 1921 and 1.43 in 1922 while ewes in good condition averaged 1.45 in 1921 and 1.68 in 1922.

6. The average weight of lamb marketed for ewes in thin-to-fair condition was 76.6 pounds and in 1922 was 90.7 pounds. The average for ewes good in condition at the beginning of the breeding season in 1921 was 86.7 pounds and in 1922 was 101.1 pounds. There was a difference of 10 pounds of marketable lamb each year in favor of ewes in good condition at the beginning of the breeding season.

7. Driving ewes for long distances before turning in the rams did not either year cause an earlier production of lambs. Ewes that were driven dropped lambs an average of 10 days later in 1921 and 4 days later in 1922.

8. The average daily gain of lambs of each sex was practically the same. The wether lambs gained .80 pound per day in 1921 and .71 pound in 1922; ewe lambs .79 pound in 1921 and .67 pound in 1922. Apparently the castration of the male lambs did not check their growth.

9. The average birth weight of the lambs seemed but little affected by the breed of the sire. The average for both years was for 69 Southdown lambs 9.67 pounds, for 82 Shropshire lambs 8.77 pounds, for 84 Hampshire lambs 9.18 pounds, for 78 Oxford lambs 9.55 pounds, and for 45 scrub lambs 9.24 pounds.

10. The per cent of lambs grading on foot as prime or fancy selects for both years, grouped according to the breed of the sire, was 64.8 for Southdowns, 46.8 for Shropshires, 58.3 for Hampshires, 42.2 for Oxfords and 9.1 for scrubs.

11. Average gains of individual lambs including both years were nearly proportional to the average size of individuals of the breed of the ram used. The average daily gain of lambs sired by Southdown rams was .70 pound, by Shropshire rams .70 pound, Hampshire rams .78 pound, Oxford rams .74 pound, and scrub rams .67 pound.

12. The average weights at marketing of all lambs including data of both years, according to the breed of the sire, were, for Southdown lambs 68.7 pounds, Shropshire 67.3 pounds, Hampshire 75.8 pounds, Oxford 75.9 pounds, and for scrubs (one year only) 65.4 pounds.

13. The lambs were sold by grade on foot in 1922. The average received for all lambs sired by purebred rams was \$10.40, while scrub lambs averaged but \$8.09 each. Had the 44 lambs sired by scrub rams been sired by purebred Down rams the returns would have been \$101.64 greater.

14. In 1922 the first shipment of lambs sired by Southdown rams sold for \$12.10 each, by the Shropshire rams \$12.93, by the Hampshire rams \$13.99 each, by the Oxford ram \$12.89 each, and the scrub rams \$10.95 each.

15. In 1922 of the carcasses of the first shipment 87 percent of the lambs sired by Southdown rams graded as strictly choice, 70 percent of the Shropshires, 53 percent of the Hampshires, 67 percent of the Oxfords, and 50 percent of the scrubs.

16. In the first shipment the carcass that ranked first was sired by a Hampshire ram, second by a Southdown ram, and third by a Shropshire ram. In the second shipment the carcass ranking first was sired by a Shropshire ram, second by a Hampshire ram and third by a Southdown ram.

17. There were but small differences in the dressing percentages of the lambs sired by purebred rams.

18. Ewes in 1922 that raised two lambs till time for marketing gave average returns from lambs sold of \$19.09, while ewes that raised but one, an average of \$10.98. Two lambs from one ewe sold for \$34.58.

19. The ewes and lambs both years were kept on rye and crimson clover throughout the winter months and received no grain throughout the year except for about a week as each ewe lambed when they were kept under open shed and fed a little grain and hay.

Acknowledgments.

Of the painstaking and untiring work of Acting-Superintendent C. M. Hume of the Middle Tennessee Experiment Station in the management of the ewe flock; for the expert assistance given each year by Mr. G. L. Watkins, of Watkins, Conithers & C Company, of Nashville, and Mr. C. C. Flanery, Assistant Specialist in Animal Husbandry, University of Tennessee, in the market grading of the lambs on foot; and the co-operation of Armour & Company, of Chicago, through their representative Mr. H. A. Phillips, in the collection of slaughter data, grateful acknowledgment is extended.
