**V Bibliography**

## I Introduction

This thesis is concerned with the protection of an embankment against erosion by current. A problem frequently met in engineering, bank erosion often has destructive effects on abutting land and structures.

A case, in point, is that treated in this paper. In 1934, a highway bridge was built over the Red Cedar River on Kalamazoo Road between Lansing and East Lansing. The outline of the banks of the river, adjacent to the bridge, was as shown in the situation plan at the end of this report. During the ensuing fourteen years to 1948, the northwest bank has been subjected to erosive action by the current. This so-called "scouring" has changed the location of that bank, as noted in the map.

The significance of this condition has been recognized by local authorities. Further scouring of the bank can result in subsequent exposure of the foundation piles supporting abutment "A". This exposure is most likely to occur when the summer low water level is less than Elev. 819.0 and the soil has been washed away under the abutment. Timber piles are most subject to decay at the water line where they become alternately wet and dry, while the portion of a pile, which remains continuously immersed in water, does not decay and lasts practically forever.

This situation warrants the designing and building of a structure to resist further erosive action. A retaining wall has been selected as the design problem herein.

Enclosed are photographs from various angles showing the present appearance of the site for the proposed retaining wall.

Photo No. 1 - Scour begins at this part of bank

Photo No. 2 - Erosion occurring on west bank

Photo No. 3 - Additional view showing scouring  
action

Photo No. 4 - Bridge adjacent to site of re-  
taining wall

B. Determination of Economical Dimensions

Pressure on base

$$C = \cos \theta \left( \frac{\cos \theta - \cos^2 \theta - \cos^2 \phi}{\cos \theta + \cos^2 \theta - \cos^2 \phi} \right)$$

$$= \frac{1 - \sin \phi}{1 + \sin \phi} = \frac{1 - .554}{1 + .554} = .287$$

$$p = Cwh = .287 \times 100 \times 16 = 459 \text{ psf}$$

$$= \frac{459 \times 16}{2} = 3680 \text{ lb.}$$

Check for trial width:

$$M_{\text{third pt.}} = 3680 \times 5.33 = \frac{3}{4}b \times 16 \times 100 \times \left( \frac{2}{3}b - \frac{3}{8}b \right)$$

$$= 19640 - 1200b \left( \frac{2}{3}b - \frac{3}{8}b \right)$$

$$19640 = 800b^2 - 450b^2 = 350b^2$$

$$b^2 = 56.1 \quad b = 7.5 \quad \text{let } b = 10'$$

Base pressures: Moments about toe:

$$W_1 = 1.5 \times 10 \times 1 \times 150 = 2250 \text{ lb.} \times 5.0 = 11,250 \text{ lb. ft.}$$

$$W_2 = 1 \times 14.5 \times 1 \times 150 = 2170 \text{ " } \times 3.0 = 6,520 \text{ " "}$$

$$W_3 = \frac{1}{2} \times \frac{1}{2} \times 14.5 \times 1 \times 150 = 543 \text{ " } \times 3.67 = 1,994 \text{ " "}$$

$$W_4 = \frac{1}{2} \times \frac{1}{2} \times 14.5 \times 1 \times 100 = 362 \text{ " } \times 3.83 = 1,386 \text{ " "}$$

$$W_5 = 6 \times 1 \times 14.5 \times 100 = \underline{8700} \text{ " } \times 7.00 = \underline{60,900} \text{ " "}$$

$$W_{\text{tot}} = 14,025 \text{ lb.} \quad 82,050 \text{ lb. ft.}$$

$$\text{Dist. from toe to } W_{\text{tot}} = \frac{82050}{14025} = 5.86 \text{ ft.}$$

$$\frac{x}{5.33} = \frac{3680}{14025} \quad x = 1.40 \quad 1.40 - .86 = .74$$

$$5.86 - 5.00 = .86$$

Eccentricity = .74 ft. ( Allowable =  $1/3$  base  $\times .50 = 1.67$ )

Since this design with base width equal to 10 ft. shows a distance of .93 ft ( $1.67 - .74$ ) between the extremity of the middle third and the point where the resultant load cuts the base, it was decided to take a smaller value for 'b' in order to obtain a more economical design. It is generally agreed that the optimum situation for economical design occurs when the resultant cuts the base of the wall at the extremity of the middle third.

Let  $b = 7.50$  ft.

Base Pressures: Moments about toe:

$W_1 = 3.5 \times 14.5 \times 100 = 5075 \text{ lb} \times 5.75 = 29200 \text{ lb.ft.}$	
$W_2 = 7.5 \times 1.5 \times 150 = 1690 \text{ ''} \times 3.75 = 6340 \text{ '' ''}$	
$W_3 = 1/2 \times 1/2 \times 14.5 \times 100 = 362 \times 3.83 = 1386 \text{ '' ''}$	
$W_4 = 1/2 \times 1/2 \times 14.5 \times 150 = 544 \times 3.67 = 1997 \text{ '' ''}$	
$W_5 = 1 \times 14.5 \times 150 = 2170 \times 3.00 = 6500 \text{ '' ''}$	
$W_{\text{tot}} = 9841 \text{ lb.}$	$45423 \text{ lb ft}$

$$\text{Dist. from toe to } W_{\text{tot}} = \frac{45423}{9841} = 4.62 \text{ ft.}$$

$$\frac{x}{5.33} = \frac{3680}{9841} \quad x = 2.00 \text{ ft.} \quad 4.62 - 3.75 = .87 \text{ ft.}$$

$$\text{Eccentricity} = 2.00 - .87 = \underline{1.13 \text{ ft.}}$$

(Allowable = 1.25)

$$\text{Base Pressure} = f = \frac{P}{A} \pm \frac{M_e}{I} = \frac{9841}{7.5} = \frac{9841 \times 1.13 \times 3.75 \times 12}{1 \times 7.5^3}$$

$$f = 1310 \pm 1185 = \frac{2495}{125} \text{ psf at toe}$$

$$\underline{125} \text{ psf at heel}$$

$$\text{Factor of safety for overturning} = \frac{W_{\text{tot}} \times \text{mom. arm}}{E \times 5.33}$$

$$\text{S.F.} = \frac{9841 \times 4.62}{3680 \times 5.33} = \frac{45423}{19600} = 2.32 \text{ (Allowable} = 2.00)$$

$$\text{Factor of Safety for Sliding} = \frac{W_{\text{tot}} \times \text{Coef. of Friction}}{E}$$

$$\text{S.F.} = \frac{9841 \times .40}{3680} = 1.07 \text{ (Anchorage not required since the soil is low in bearing capacity and piles will be driven)}$$

Sometime during the spring, the Red Cedar River can be counted on to reach flood levels and overflow its banks. Because of this, the forces acting will be analysed herein.

As shown in the following sketch, the earth pressure of water pressure tend to cancel each other and consequently the resultant force cuts the base closer to the center than at low water. Therefore, the base pressure is less at the toe than before.

The picture is also improved for shear along face a-b. The bending moment on the stem could possibly be changed an appreciable amount, however.

C. Investigation of Forces during High Water

Moments about face a-b =  $3680 \times 5.33 - 2000 (9.17)$   
 = 540 ft lb = 6500 in lb.

$d = \frac{V}{b_j v} = \frac{1680}{12 \times 7/8 \times 40} = 4.00 \text{ in.}$

$d = \frac{M}{R_b} = \frac{540}{139} = 1.98 \text{ in}$

assume  $d = 12''$  at this point

$A_s = \frac{M}{f_s j d} = \frac{6500}{1800 \times 7/8 \times 12} = .034 \text{ in.}^2$

This area of steel will be taken care of by temp. steel spaced 3'-0" c/c  $\frac{1}{8}'' \phi = .20 \text{ in.}^2$

D. Design of Heel Slab

$W_2 = 1.5 \times 3.5 \times 150 = 787.5 = 788$

$R_1 = 125 \times 3.5 = 437.5 = 438$

$R_2 = 1110 \times \frac{1}{8} \times 3.5 = 1940$

Moments about a-b:

$+5075 (1.75) + 788 (1.75) - 438 (1.75) - 1940 (1.17) = 0$

$10250 - 767 - 2270 = 7,213 = M \text{ a-b.}$

Bending causes tension in top fibers of heel slab.

$$V = 5075 + 788 - 438 - 1940 = 3485 \text{ lb.}$$

$$d = \frac{V}{b_j v} = \frac{3485}{12 \times 7/8 \times 60} = \underline{5.53 \text{ in.}}$$

$$d = \frac{M}{k_b} = \frac{7213}{139} = 51.9 \quad \frac{Z}{2375} = \frac{3.5}{7.5}$$

$$Z = 1110 \text{ psf}$$

$$d = \underline{7.20 \text{ in.}} = \text{minimum "d"}$$

In this case assume  $d = 15 \text{ in.}$  with 3 in. cover.

Check for allowable shear:

$$v = \frac{V}{b_j d} = \frac{3485}{12 \times 7/8 \times 15} = \underline{22.1 \text{ psi}}$$

Steel Design for Heel Slab:

$$A_s = \frac{M}{f_s j d} = \frac{7213 \times 12}{18,000 \times 7/8 \times 15} = .366 \text{ in.}^2 \text{ reqd. per 12 in.}$$

Use 2 -  $\frac{1}{2}$ "  $\phi$  bars = .40 in.<sup>2</sup> Top

$$\frac{12}{2} = 6" \text{ spacing c/c}$$

Check for Bond Stress:  $\leq \sigma = 3.14 \text{ in.}$

$$M = \frac{V}{\leq \sigma j d} = \frac{3485}{3.14 \times 7/8 \times 15} = \underline{84.5 \text{ psi}} < 100 \text{ O.K.}$$

Therefore, special anchorage not required.

$$L = \frac{f_s D}{4u} = \frac{18000 \times .5}{4 \times 100} = \underline{22.5 \text{ inches.}}$$

$\frac{1}{2}$ "  $\phi$  - 5'-2" - 6" c/c Heel Reinf.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that proper record-keeping is essential for transparency and accountability, particularly in the context of public administration and government operations. This section also highlights the role of technology in streamlining record management processes and reducing the risk of errors or data loss.

2. The second part of the document focuses on the implementation of robust internal controls and risk management frameworks. It outlines the need for regular audits and assessments to identify potential vulnerabilities and ensure that organizational policies are effectively enforced. This section also discusses the importance of employee training and awareness programs in fostering a culture of compliance and ethical behavior.

3. The third part of the document addresses the challenges of data security and privacy protection in the digital age. It highlights the need for strong encryption protocols, access controls, and regular security updates to safeguard sensitive information from unauthorized access and cyber threats. This section also discusses the importance of data backup and recovery strategies to ensure business continuity in the event of a data breach or system failure.

4. The fourth part of the document discusses the importance of stakeholder communication and engagement. It emphasizes the need for clear, consistent, and timely communication with all relevant parties, including employees, customers, and the public. This section also discusses the role of transparency in building trust and credibility, and the importance of listening to feedback and addressing concerns in a proactive and responsive manner.

5. The fifth and final part of the document provides a summary of the key findings and recommendations. It reiterates the importance of a holistic approach to organizational governance, one that integrates financial, operational, and ethical considerations. The document concludes by encouraging leadership to take decisive action on the identified issues and to foster a culture of continuous improvement and innovation.

E. Design of Toe Slab

$$\frac{Z}{2375} = \frac{2.5}{7.5}$$

$$Z = 793 \text{ psf}$$

$$W = 1.5 \times 150 \times 3.5 = 788 \text{ lb.} \quad R_3 = 125 \times 2.5 = 313 \text{ lb.}$$

$$R_4 = 793 \times \frac{1}{2} \times 2.5 = 990 \text{ lb.} \quad R_5 = 1582 \times 2.5 = 3950 \text{ lb.}$$

Moments about face B-B:

$$-788 \times 1.25 + 313 \times 1.25 + 3950 \times 1.25 + 990 \times 1.67 = 6000 \text{ ft. lb.}$$

$$4350 + 1650$$

Shear =  $V = 4465 \text{ lb.}$  Assume toe 18" thick &  $d = 15"$

$$v = \frac{V}{bd} = \frac{4465}{12 \times 7/8 \times 15} = 28.3 \text{ psi}$$

$$R = \frac{M}{bd^2} = \frac{6000}{225} = 26.7$$

$$A_s = \frac{M}{f_s j d} = \frac{6000 \times 12}{18,000 \times 7/8 \times 15} = .305 \text{ in.}^2 \text{ req'd. per foot.}$$

Use  $2 - \frac{1}{2}" \phi$  bars =  $.40 \text{ in.}^2$  Bottom  
at 6" spacing c/c

Check for Bond Stress:

$$u = \frac{V}{\sum o j d} = \frac{4465}{3.14 \times 7/8 \times 15} = 108 \text{ psi}$$

$$L = \frac{f_s D}{4u} = \frac{18000 \times \frac{1}{2}}{4 \times 100} = 22.5 \text{ inches.}$$

F. Design of Stem

$$P = Cwh = .287 \times 100 \times 14.5 = 416$$

$$E = \frac{416 \times 14.5}{2} = 3010 \text{ lb.}$$

$$\text{Shear} = 3010 \text{ lb.}$$

$$\text{Moment} = 3010 \times 4.83 \times 12 = 174,500 \text{ in. lb.}$$

$$d = \frac{V}{b j v} = \frac{3010}{12 \times .7 \times 8 \times 40} = 7.17 \text{ inches}$$

$$d = \frac{M}{R_b} = \frac{14540}{139} = 104.5 = 10.2 \text{ inches}$$

Let  $d = 15 \text{ in.}$

Make stem 12 in. at top  
& 18 in. at bottom

$$V_x = \frac{28.7h^2}{2}$$

$$M_x = \frac{28.7h^2}{2} \left( \frac{h}{3} \right)$$

$$V_x = 14.35 h^2$$

$$M_x = \frac{28.7h^3}{6} = 4.78h^3$$

Steel required at junction of stem & base:

$$A_s = \frac{M}{f_s j d} = \frac{174,500}{18000 \times .7 \times 8 \times 15} = .738 \text{ in.}^2$$

Use 3- $\frac{1}{2}$ "  $\phi$  bars gives .75 in.<sup>2</sup> per 12 inches

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice to ensure transparency and accountability.

2. The second part outlines the procedures for handling discrepancies between the recorded amounts and the actual cash received. It states that any such variance must be investigated immediately and reported to the appropriate authority.

3. The third part details the process for reconciling the accounts at the end of each month. It requires that the total recorded income matches the bank statements and the physical cash on hand.

4. The fourth part discusses the role of the auditor in verifying the accuracy of the records. It notes that the auditor has the right to request any supporting documents and to conduct interviews with the staff involved.

5. The fifth part provides a summary of the key findings from the audit. It highlights the areas where the records were found to be accurate and the areas where there were errors or omissions.

6. The sixth part offers recommendations for improving the record-keeping process. It suggests implementing a more robust system for tracking transactions and ensuring that all staff are trained in the correct procedures.

7. The seventh part concludes the report by reiterating the importance of maintaining high standards of financial integrity and transparency. It expresses confidence in the overall performance of the organization, provided that the recommended improvements are implemented.

Longitudnal bars in base: Use  $\frac{1}{2}$ "  $\phi$  bars - 18" c/c

## H. Design of Piles

Although data concerning soundings was not available for this design, helpful information was contributed by Mr. W. C. Gunn, Civil Engineer. Mr. Gunn was the construction engineer for the bridge job and consequently is familiar with the supporting characteristics of the soil. Considering the soil pressure developed at the toe, of the wall in this design, he advised the addition of timber piling to assure ample support.

The problem of spacing and size of piles was taken up with Prof. C. A. Miller, Dept. of Civil Engineering. His reference to a graphical method of determining this spacing was greatly appreciated along with his other helpful assistance on the design of the wall.

Use 15 feet long piles, measuring 12 inches at butt and tapering down to 9 inches at the tip. These piles can be rated at 15 tons in this soil according to Mr. Gunn.

The graphical method for determining spacing is shown on the following page. Since the theoretical center-line of the piles on the toe side is only 1 foot from the toe, the piles will be moved in another 6 inches. This will fulfill the required minimum distance of 18 inches from pile center-line to edge of concrete. The second line of piles at 4 feet from the toe will be moved a corresponding distance.

# Graphical Method of Determining Spacing of Piles

General  
Notes

Calculation of load transfered to each pile:

Load per pile =  $\frac{2500\text{psf} + 1770\text{psf}}{2} \times 2.3 \times 4.5 = 22,100 \text{ lb.}$   
 with  $4\frac{1}{2}$  ft.  
 longitudinal  
 spacing.

Load per pile equals approx. 11 tons.  
 Allowable pile capacity = 15 tons.

#### I. Drainage Weepholes

The drainage problem for this retaining wall is somewhat different from the ordinary. Since the usual location of weepholes near the bottom of the stem is, in this case, below the river bed, the outlet will be placed at a higher elevation (820 ft.). Above this point bankrun gravel is to be filled in as a filtering medium for catching silt and other foreign matter which would tend to clog the drains.

The weepholes are to be constructed by building 6" x 6" boxes integrally with the stem forms. This technique is desirable because scrap lumber can be used for the boxes and the work need not be complicated by a possible difference in tile lengths and wall thickness.

### III Construction Estimate

#### A. Current Unit Prices

In the construction field, unit prices fluctuate due to many varying conditions. Therefore, it is often difficult to predict at a glance how much a certain structure will cost to build.

For this problem, the writer consulted with an engineer connected with a local contracting firm to get a typical picture of the current prices in this area. The co-operation of Mr. Dave Cole of the Reniger Construction Company was greatly appreciated in connection with this matter.

The following unit prices will be used herewith:

#### Excavation

Power excavate - 80¢/yd.

Backfill - 25¢/yd.

#### Concrete

Materials: 2500lb. - 5 sack concrete - \$8.70/yd. delivered (ready mix)

Labor: Footing concrete - \$2.00/yd.

Wall concrete - \$3.50/yd.

Forms: Footings - Material - 15¢/sq.ft.

Labor - 25¢/sq.ft.

Walls - Material - 38¢/sq.ft.

Labor - 50¢/sq.ft.

Const. joint - 50¢/lin.ft.

## Reinforcing Steel

Material: Deformed, intermediate grade, billet steel will be used.

Material Fabricated - \$125/ton (this figure includes accessories such as tie wire, beam chairs & spacers.)

Placing Steel - \$50.00/ton

## Carborundum Rub (surface finish)

Material -  $\frac{1}{2}$ ¢/sq.ft.

Labor - 30¢/sq.ft.

## Overhead - 10%

Includes: supervision, timekeeping, layout, expediting, sheds, workmen's compensation, social security.

## Bonds - $\frac{1}{2}$ %

Profit - 10% for a job of this type and size.

## B. Quantitie of Materials Estimate

Concrete : Footing - Vol. =  $\frac{28}{12} \times 7.5 \times 370.7 \times 1/27 = 240$  cu.yds.

Deduct cylinders for pile heads:

$$\text{Vol. of one cyl.} = \frac{\pi d^2 h}{4} = .785 \times 1 \times \frac{10}{12} = .655 \text{ cu.ft.}$$

$$.655 \text{ cu.ft./cyl.} \times 166 \text{ cyl.} = 108.5 \text{ cu.ft.}$$

$$\frac{108.5}{27} = 4.0 \text{ cu.yds.}$$

$$240 - 4 = \underline{236 \text{ cu.yds.}} = \text{conc. vol. in footing}$$

$$\text{Stem - Vol.} = \frac{1 + 1.5}{2} \times 14.5 \times 370.7 \times 1/27 = \underline{249 \text{ cu.yds.}}$$

$$\text{Total Concrete Yardage} = 236 + 249 = 485 \text{ cu.yds.}$$

Steel : Footing steel top -  $\frac{1}{2}$ "  $\phi$  bars 5'-2" rods @ 6" c/c

$$2 \times 370 = 740 \text{ rods} \quad 740 \times 5.17 = 3820 \text{ lin.ft.}$$

Footing steel bottom -  $\frac{1}{2}$ "  $\phi$  bars 4'-2" rods @ 6" c/c

$$2 \times 370 \times 4.17 = 3080 \text{ lin.ft.}$$

Footing steel longitudinal -  $7\frac{1}{2}'' \text{ } \emptyset$  rods, entire length  
of wall

$$7 \times 370 = 2590 \text{ lin.ft.}$$

Dowel steel -  $\frac{1}{2}'' \text{ } \emptyset$  bars - 4'-0" - 4" c/c

$$3 \times 370 \times 4 = 4440 \text{ lin.ft.}$$

Stem steel -  $\frac{1}{2}'' \text{ } \emptyset$  bars - 7'-0" - 8" c/c

$$1.5 \times 370 \times 7 = 3880 \text{ lin.ft.}$$

Temp. steel horiz. -  $\frac{1}{2}'' \text{ } \emptyset$  bars

$$15 \times 370 + 19 \times 370 = 12,580 \text{ lin.ft.}$$

Temp. steel vert. -  $\frac{1}{2}'' \text{ } \emptyset$  bars - 14'-6" - 3'-0" s/c

$$14.5 \times 123 \text{ rods} = 1780 \text{ lin.ft.}$$

Totals: 8320 lin.ft. of  $\frac{1}{2}'' \text{ } \emptyset$  bars

23850 lin.ft. of  $\frac{1}{2}'' \text{ } \emptyset$  bars

$\frac{1}{2}'' \text{ } \emptyset$  bars weigh .850 lb/lin.ft.

$\frac{1}{2}'' \text{ } \emptyset$  " " .668 lb/lin.ft.

$$\text{Total wt.} = 8320 \times .850 + 23,850 \times .668 = 23,020 \text{ lb.}$$

$$= 11.50 \text{ tons}$$

Excavation: Slope trench  $60^\circ$  with horizontal

$$\text{Volume of excavation} = \frac{178 \times 370}{27} = 2440 \text{ cu.yd.}$$

C. Cost Estimate

Power Excavate - 2440 cu. yds. x .80¢/cu.yd. = \$ 1950.00

Backfill - 1450 cu.yds. x .25¢/cu.yd. = 362.00

Forms:Footing:

Materials - 15¢/sq.ft. x 370 ft. x  $\frac{28}{12}$  x 2 = 259.00

Labor - 25¢/sq.ft. x 370 x  $\frac{28}{12}$  x 2 = 432.00

Forms:Stem:

Materials - 38¢/sq.ft. x 14.5 x 370 x 2 = 4080.00

Labor - 50¢/sq.ft. x 14.5 x 370 x 2 = 5370.00

Footing Concrete:

Materials - 236 cu.yd. x 8.70/cu.yd. delivered = 2050.00

Labor - 236 cu.yd. x 2.00/cu.yd. = 472.00

Stem Concrete:

Materials - 249 cu.yd. x 8.70/cu.yd delivered = 2170.00

Labor - 236 cu.yd. x 3.50/cu.yd. = 872.00

Construction joints:

One joint every 40 ft. = 92 joints

22 lin.ft./joint x 92 joints x 50¢/lin.ft.= 1010.00

Reinforcing Steel:

Materials - 11.5 tons x \$125/ton = 1440.00

Labor (placing) - 11.5 tons x \$50/ton = 575.00

Carborundum Rub: upper 8ft. of front surface of stem will be rubbed for appearance.

Materials: - 8 x 370 x  $\frac{1}{2}$ ¢/sq.ft. = 14.80

Labor - 8 x 370 x 30¢/sq.ft. = 888.00

Piling: 166 piles x \$60/pile (driving + materials) = 9950.00

Tot. = 31894.80

Contractor's overhead = 10% = 3189.48

35084.28

Contractor's profit = 8% = 2810.00

\$ 37894.28
