The prosperity of Mr I.O Prelps. of this city, is proof of whatcan be done Last fall he came to this city, in a financial condition, which the boys call 'busted." Not being able to find work read- fragility and certain cases of imbediaty ily, he took a rope and tin strips, and cleaned chimneys. This work proved very lucrative, and he soon found a house where he and his family located. He is a barber by trade, and eventualty, he found employment at that business. By economy and hard work he accumulated sufficient money to purchase one of the finest barber shops in the citythe one formerly owned by Wm. Honeker. He employs two men, and declares in his jocose way, that "business is hopping." His success is due to hard work, good habits, strict attention to business, and a happy disposition.

Has more separation than any other machine. It will separate faster and better. This Thresher is made with tight floor, so there is no litter or dust, which is a very important point over other machines. Our mill is large, and sieves are wider and longer, and with our New Improved End Shake will save and clean the grain ready for market. The GROTON NEW MODEL is built with arched sills, so that it can be turned around in a VERY SMALL SPACE, saving all trouble of lifting or running against doors, fences, etc., etc.

THE GROTON ENGINE uses less coal and water than any other engine built, giving the same amount of hower. This engine is so nicely balanced that it needs no blocking whatever, except to keep the belt from pulling it ahead. We put a fusible plug into the crown sheet of all of our boilers, which, in case of low water, will melt and put out the fire, thereby ensuring posi-

Our Smoke-stacks are arranged with a perfect spark arrester, so there is noka possible AVERY'S PATENT REVERSE GEAR is used on all our Tractions. With one lever the engineer has full control of his engine, -can reverse it at will, and can out of his steam from zero to full stroke.

THE DRIVING OR ROAD WHEELS of our Traction Engine are sixty inches in diameter, with twelve inch face, and are made principally of steel, wrought and malleable iron. The lugs, or traction pieces, are of peculiar shape, best adapted to adhere to the ground, and are held in place by nuts, and, in case of wear, can be renewed at a trifling expense, without throwing away the whole wheel. By this construction of a wheel we secure lightness, elasticity, durability, and strength, with a minimum of weight; and with the large and broad tires, it is only in very extreme cases that we are obliged to resort to locking the drive wheels, or putting on extra lugs to climb the steepest grades, or to get out of the worst ruts.

PATENT SPRING ATTACHMENT to the intermediate gear, which relieves the trrain of gearing from sudden shocks, breaks, etc., caused by the drive wheels running over obstructions, is a very desirable attachment to any traction engine.
